

OVERVIEW

Our fine spray hydraulic atomizing nozzles are available in two styles.

Standard Nozzles: Traditional threaded nozzles made of metal.

Quick-Connect Nozzles: Consisting of a nozzle body and spray tip, quick-connect nozzles can reduce maintenance time and lower costs. The spray tips can be removed for cleaning and/or replacement while the nozzle bodies remain on the pipe or spray header.

• **UniJet® Nozzles:**

– Simply unscrew the retainer cap and remove the spray tip by hand. Then install the new spray tip and tighten the retainer cap to secure the spray tip in place.

– Available in metal materials.

Watch for the UniJet designation on the following pages. These nozzles are available with a wide variety of body types, mounting options, adapters, plugs, strainers, check valves, plates, fittings and more. See Section L, Accessories, for complete information.
