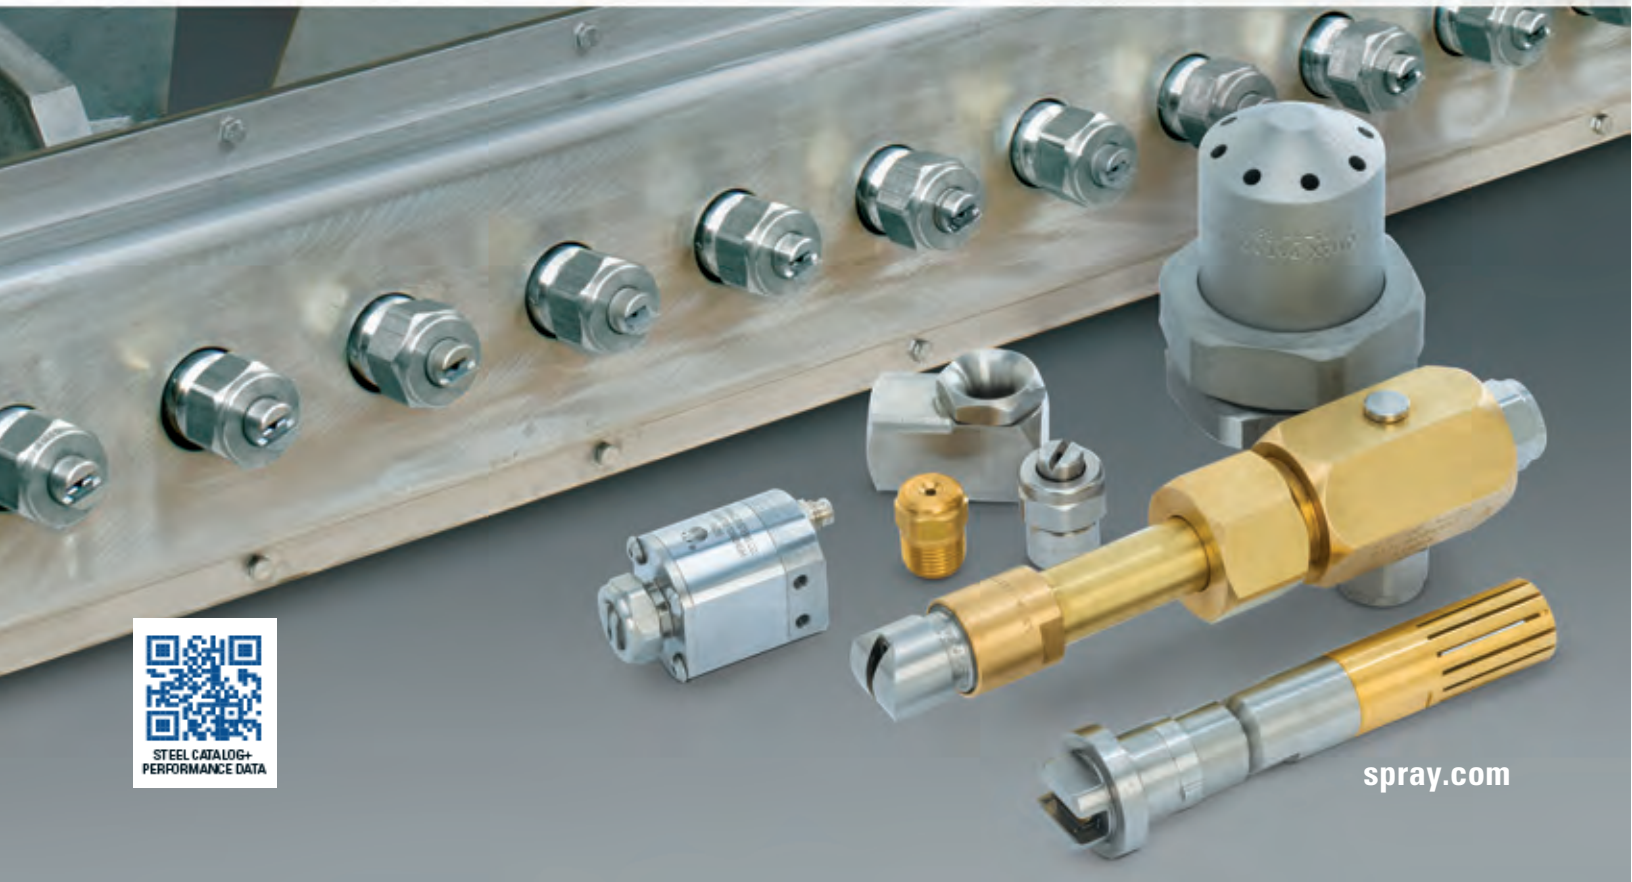
Spraying Systems Co.®
Experts in Spray Technology

SPRAY TECHNOLOGY FOR STEEL MILLS



STEEL CATALOG+ PERFORMANCE DATA

spray.com

THANK YOU FOR YOUR INTEREST IN OUR SPRAY PRODUCTS FOR STEEL MILLS.

We look forward to helping you optimize your operations involving spray technology. We're uniquely qualified to assist:

Many of our nozzles, headers and systems are specially-designed for use in steel mills. Our products are optimized for impact, heat transfer, cooling efficiency, pressure, coverage, water conservation, quick maintenance and more. We have the most comprehensive line of spray products available but we are always willing to make nozzles in different materials and sizes to ensure you get the performance you need. Spray headers and lances are built-to-order; again to optimize performance in your operation.

Our offering goes beyond nozzles, lances and systems. We provide a wide range of testing and modeling services to ensure the desired performance is achieved in critical applications. By simulating your operating conditions in our spray laboratories or with Computational Fluid Dynamics (CFD) modeling, we can determine which nozzles, header layouts and lance designs will be most effective and meet your operational objectives.

Our spray expertise is unmatched. Our sole focus has been on spray technology for more than 75 years. Engineering and technical support are provided to mills around the world from our ten manufacturing facilities and more than 90 sales offices. No-cost optimization, inspection, maintenance and other educational programs are readily available as well.

Let us show you why mills around the world rely on us to help boost production, improve steel quality, lower operating costs, minimize waste and more. Just give us a call or visit spray.com to learn more.

FABRICATION AND TESTING

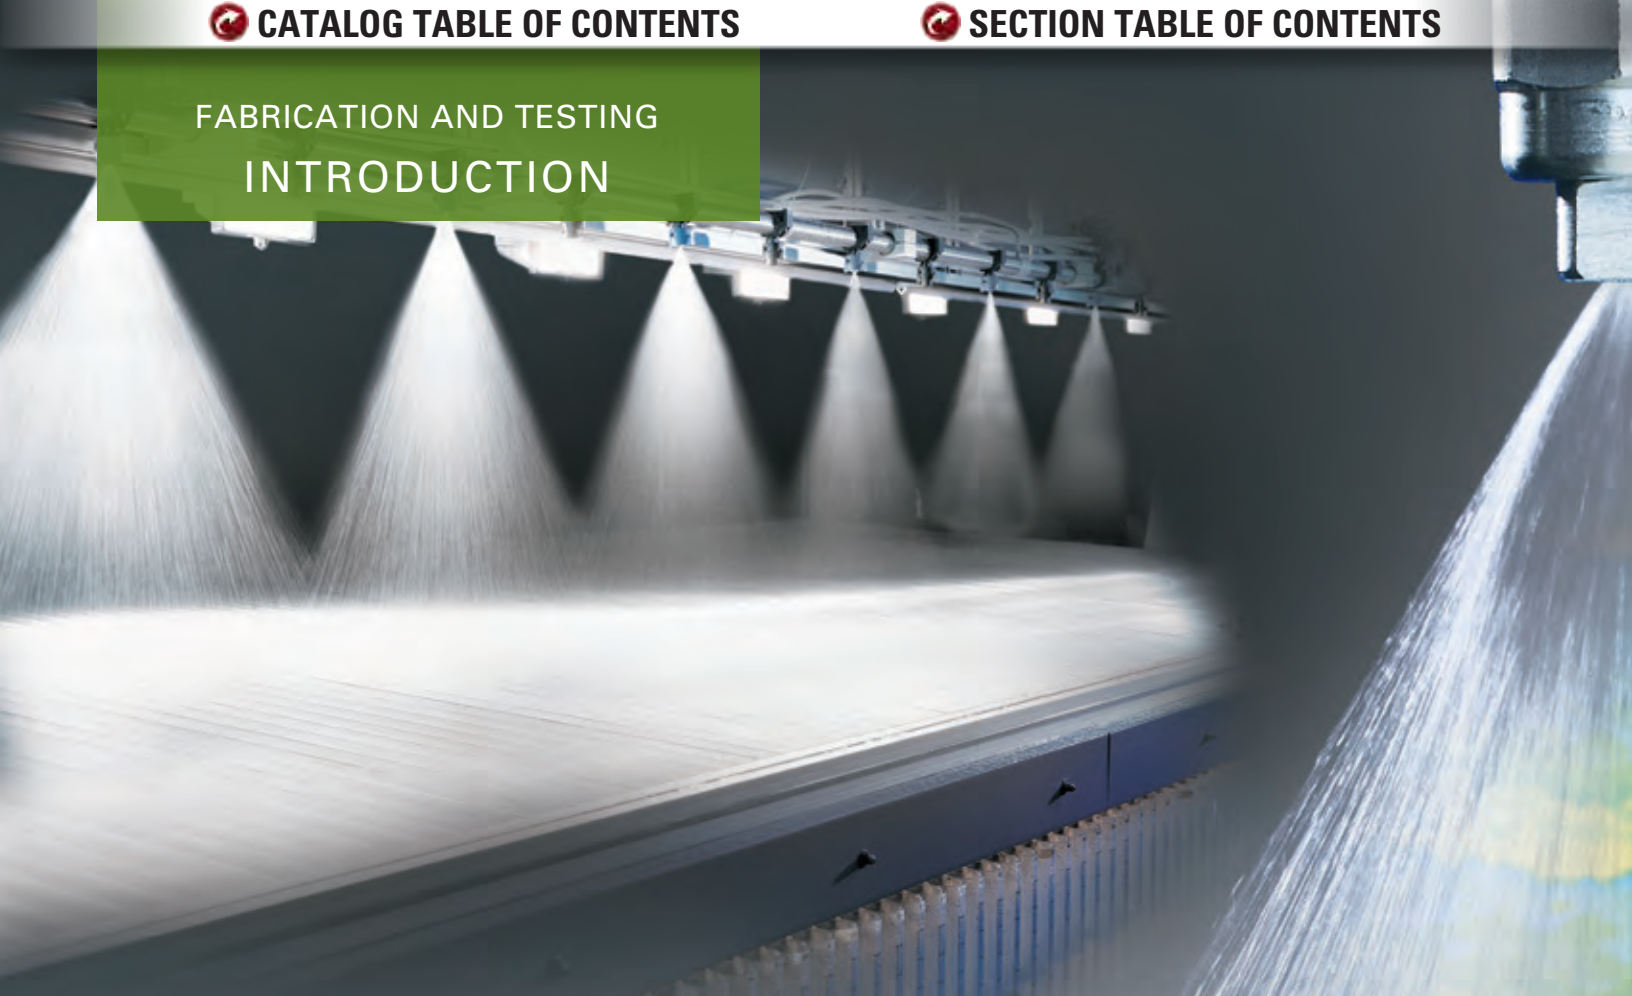
INTRODUCTION



UNIQUE MODELING, TESTING AND FABRICATION SERVICES HELP ENSURE OPTIMAL PROCESS QUALITY

The most critical components in any spray system are the spray nozzles. Choosing the nozzles that will deliver the precise performance required for your operation is essential to quality. Impact, flow rate, coverage, heat transfer and other factors can make the difference between clean, scale-free steel and dirty, streaky, dimpled and uneven products that require rework or have to be scrapped.

Once the nozzles are selected it is just as important to evaluate placement/positioning and the equipment that feeds the nozzles. Having properly designed headers/manifolds and lances is also essential to producing high quality products. Inadequate fluid flow or improper placement of the nozzles can result in inadequate cooling, descaling and coating.

We work closely with customers to optimize quality and efficiency. This begins with nozzle selection and header design. In some cases, we use our spray laboratories to validate performance or troubleshoot existing problems. When actual operating conditions cannot be simulated in our labs, we often use sophisticated modeling tools such as Computational Fluid Dynamics (CFD) and proprietary software for gas cooling to help predict performance once installed in the mill.

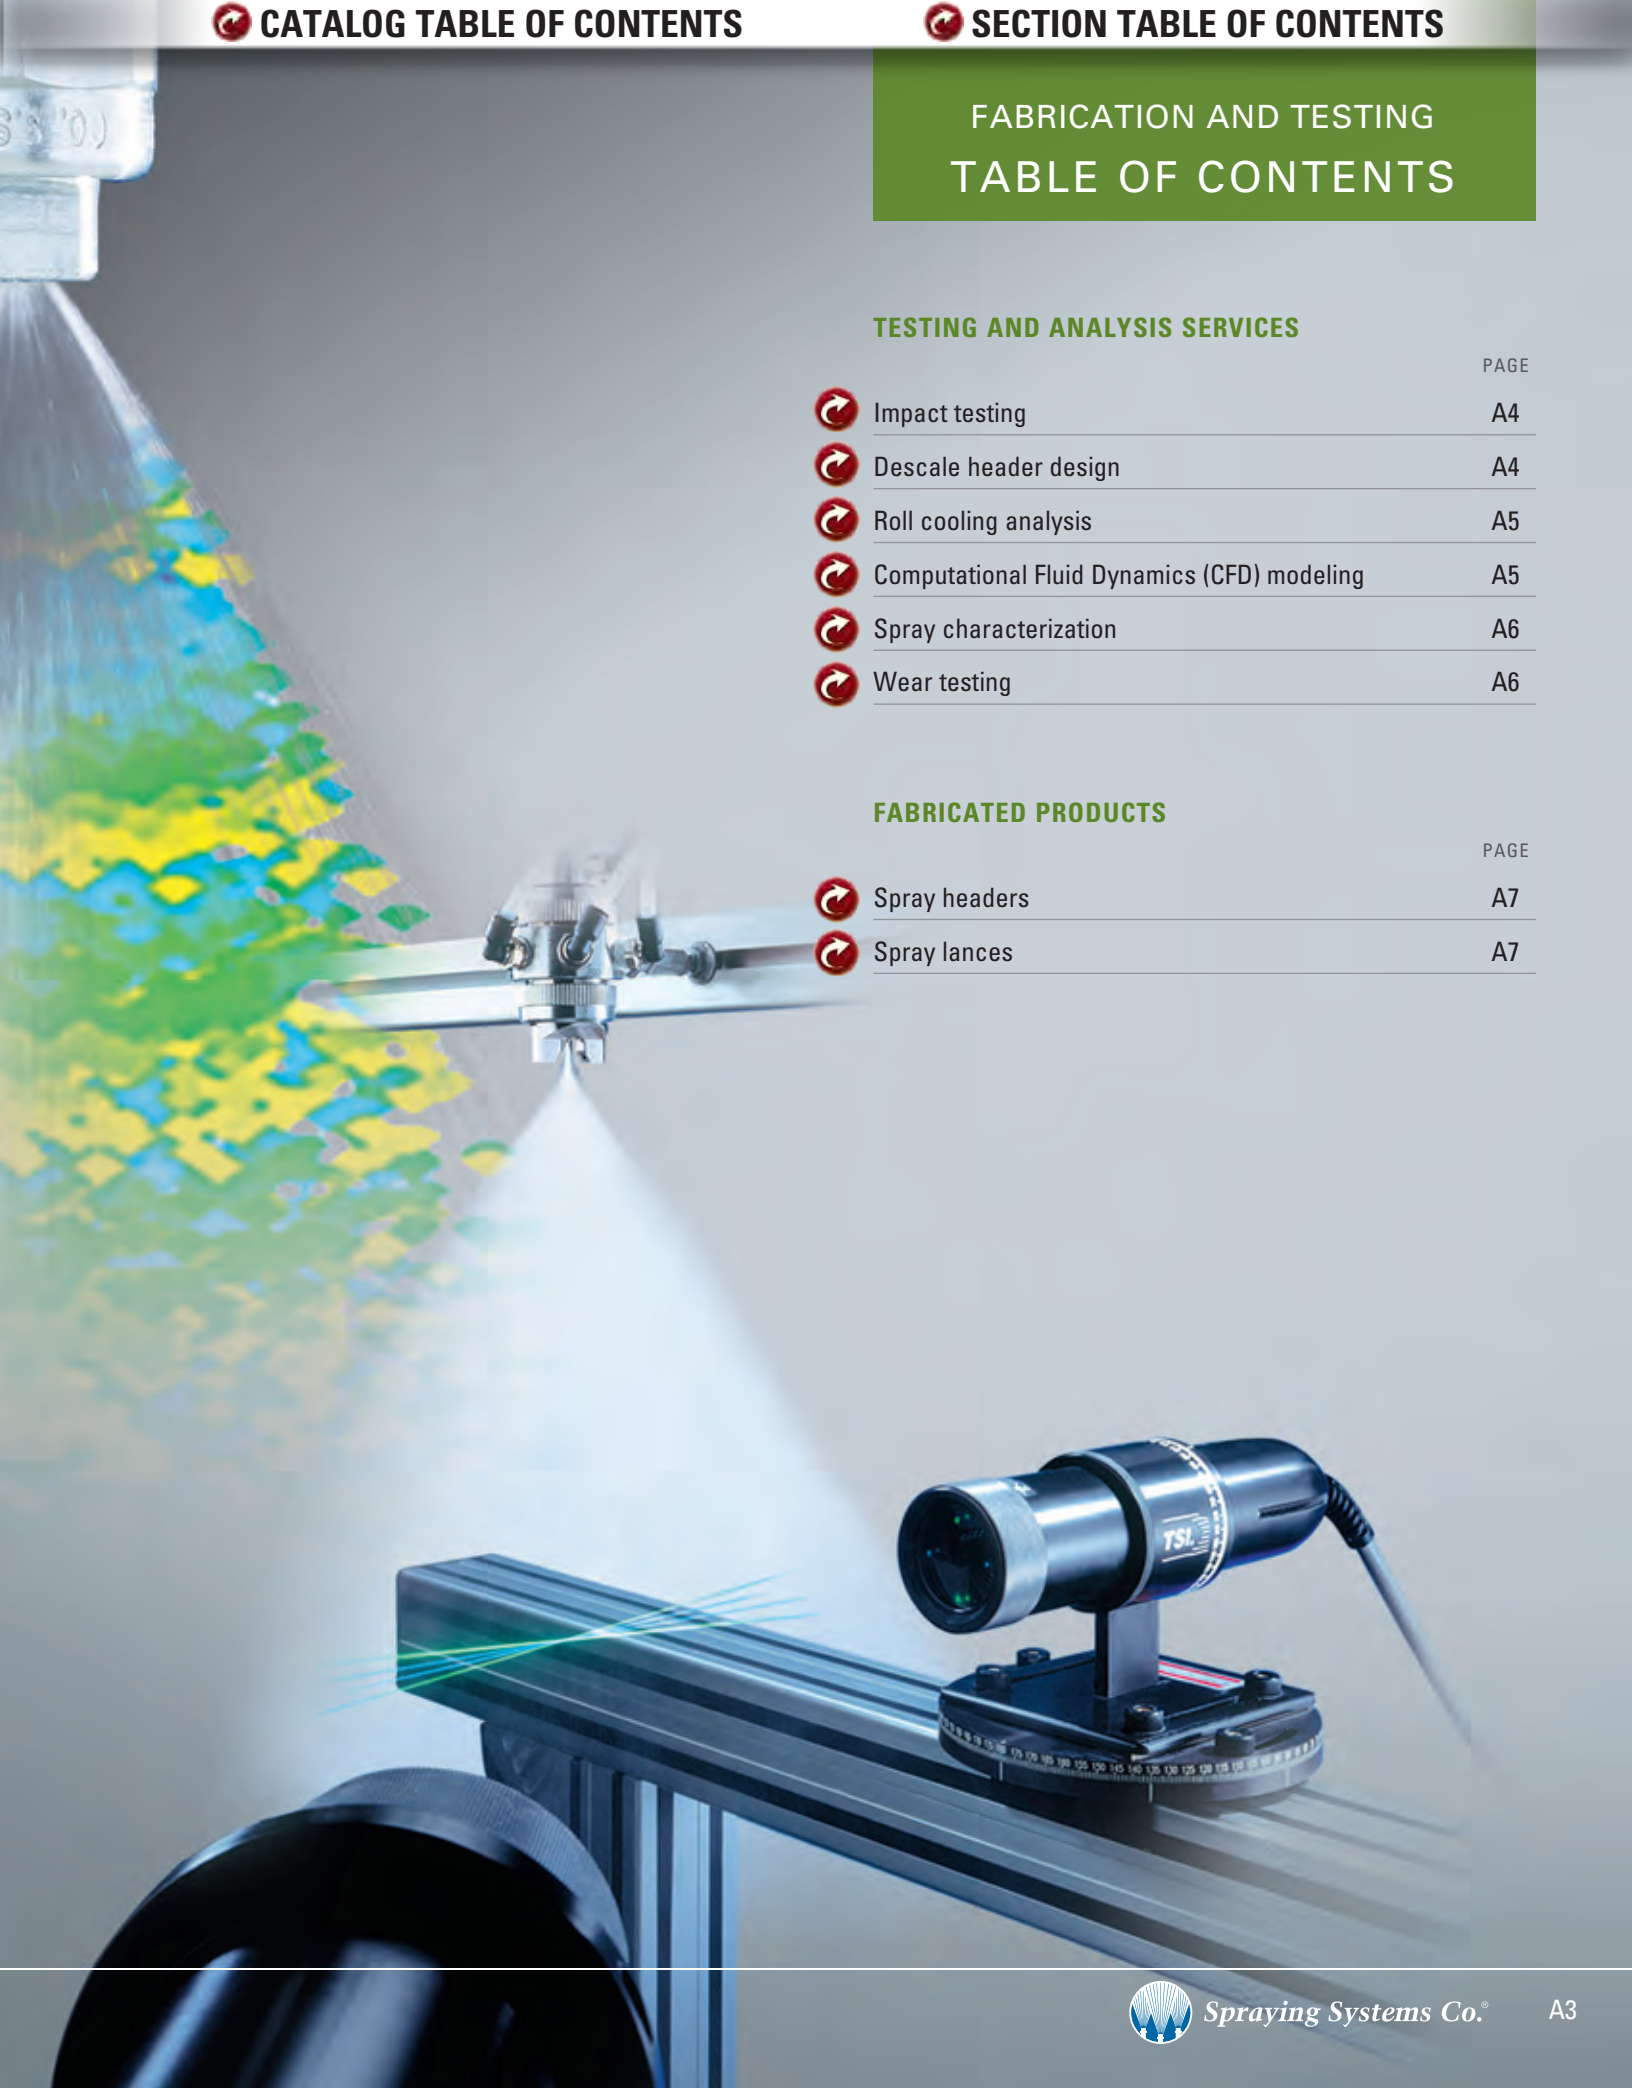
In addition to assisting with nozzle selection, we often fabricate the headers and lances required to ensure optimal performance. Single source supply of nozzles and headers provides convenience in addition to eliminating any equipment compatibility issues.

FABRICATION AND TESTING

TABLE OF CONTENTS

TESTING AND ANALYSIS SERVICES

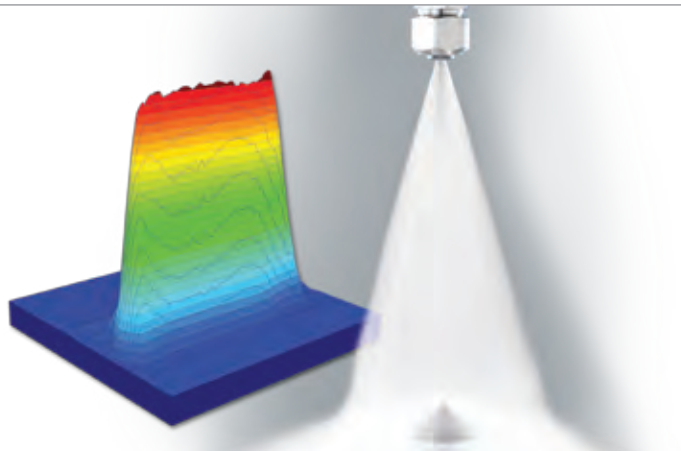
FABRICATED PRODUCTS



IMPACT TESTING

OVERVIEW:

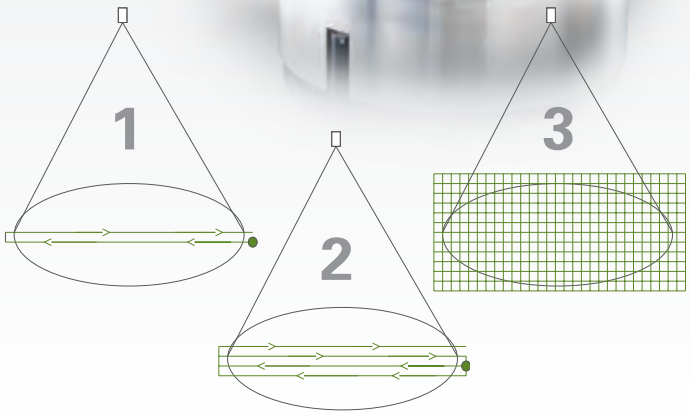
Impact can be calculated using theoretical calculations. However, these calculations do not account for turbulence, spray rebound and splash back – all of which can have a significant effect on impact. To determine actual impact, the data must be collected and analyzed. In the absence of a commercially-available piece of test equipment that measured all the required attributes, we designed our own impact tester to collect data on two axes. From this, we can determine the impact force, lateral distribution and transverse distribution.



HOW THE IMPACT TESTER WORKS:

We typically compare performance of several different nozzles using different operating conditions to ensure optimal scale removal.

- The load cell of the impact tester first moves to the outside of the spray pattern
- It then traverses through the spray taking measurements at predetermined intervals
- The load cell continues back and forth through the spray unit until the entire spray area has been covered
- The data from the testing provides coverage information, impact pressure values and the uniformity of the impact distribution across the spray pattern



For more information on impact testing and to learn more about how it can improve your descaling operations, contact your local steel specialist.

DESCALE HEADER DESIGN

OVERVIEW:

DescaleWare®, our proprietary software for header layout and nozzle selection, helps ensure the best possible results in your operating environment.

The software:

- Determines which nozzles provide the desired performance in your environment
- Graphically displays the header layout including nozzle type, spacing, coverage, spray height, lead angle and impact values
- Is suitable for use with all steel shapes

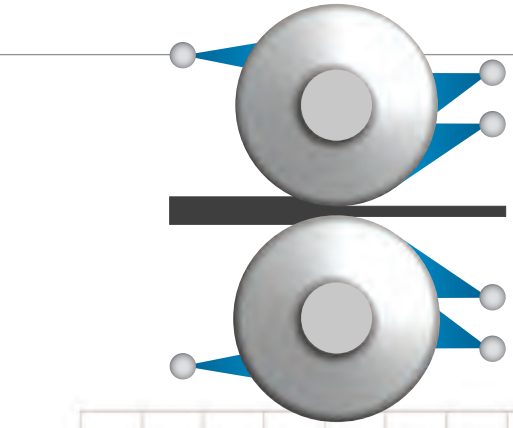
For more information about DescaleWare, contact your local steel specialist.

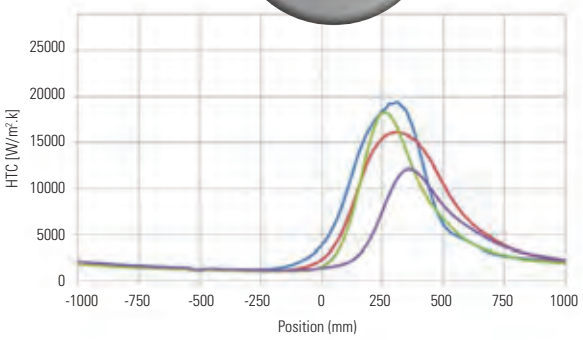
ROLL COOLING ANALYSIS

OVERVIEW:

We offer a full-range of services for roll cooling optimization:

- Analysis to determine the current profile and recommendations on how to improve the profile distribution. This includes evaluation of spray patterns, nozzle and header locations
- Heat transfer analysis and recommendations on possible changes to the current roll cooling configuration to improve performance including how best to use available water

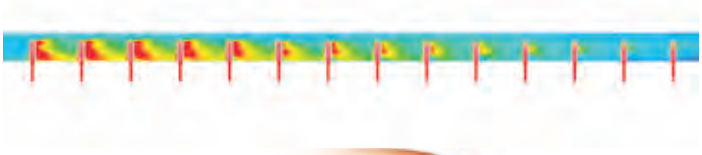


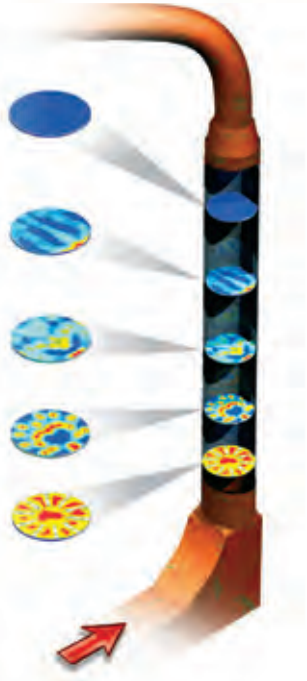


COMPUTATIONAL FLUID DYNAMICS (CFD) MODELING

OVERVIEW:

We use Computational Fluid Dynamics (CFD) modeling to help achieve an optimized spray solution. Simulation provides more information about the key factors that impact the success of an application. Modeling allows us to investigate many parameters that may be difficult or impossible to replicate in a laboratory environment. Our models use known inputs collected in our spray laboratories instead of theoretical data. This proprietary data improves model accuracy and illustrates flow patterns, velocity, turbulence, droplet trajectories, internal system pressure and more.





Typical uses for CFD modeling include:

- Determination of optimal header size and nozzle placement
- Descale header design validation
- Turbulence analysis in descale header design
- Gas cooling/conditioning analysis to determine lance and nozzle placement in ducts, scrubbers, furnaces, cooling towers and more
- Internal flow characteristics of spray nozzles under specific operating conditions

For more information about CFD modeling, contact your local steel specialist.

SPRAY CHARACTERIZATION

OVERVIEW:

In operations where spray performance is critical, it is important to understand how factors like these affect performance:

- Process conditions such as pressure, temperature and variable line speeds
- The liquid being sprayed
- The placement and position of nozzles in relation to the target

In many cases, experience and theoretical calculations can provide an indication of actual spray performance. However, testing in our spray labs determines actual performance and can eliminate costly specification mistakes or quality problems after installation.

While testing in our labs, we can adjust operating conditions and/or test different nozzles to find the exact performance required for your operation.

Common tests include:

- Spray characterization
- Drop size distribution
- Spray impact
- Spray pattern
- Spray coverage
- Spray angle
- Evaporation rate
- Residence time
- Dwell time

WEAR TESTING

OVERVIEW:

Descale nozzles are manufactured to exacting standards to deliver very precise performance. And, like any precision component, nozzles will wear over time. This wear is not always visible – especially in the early stages. However, even slight wear (10 to 15%) can cost thousands of dollars per month in wasted water, energy and disposal costs. In addition, you may experience quality problems since wear compromises impact pressure.

We offer a free nozzle wear testing program for our customers. Program details:

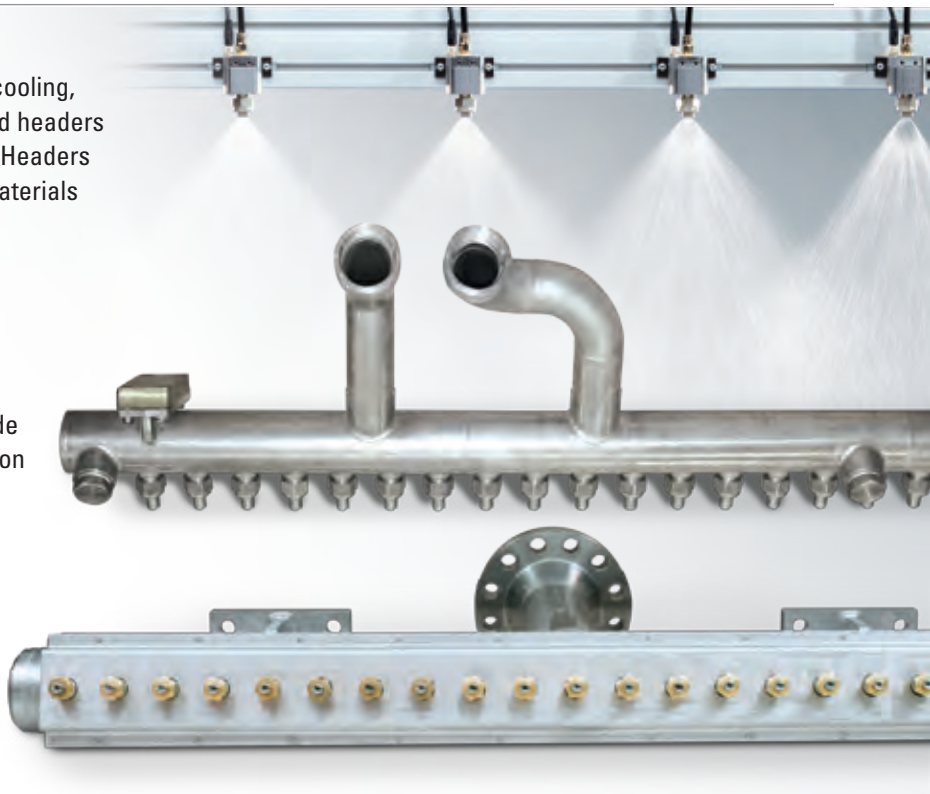
- Ship nozzles from various points on a single header to us after they've been in use for several months
- Tests will be conducted in our spray labs to determine the wear rate
- Your nozzles will be returned to you along with recommendations for optimal replacement intervals

Contact your local steel specialist for complete details.

SPRAY HEADERS

OVERVIEW:

Whether you require a spray header for descaling, cooling, cleaning or rinsing we can help. We design and build headers for a wide range of operations throughout your mill. Headers can be built in a wide range of shapes, styles and materials to accommodate any nozzle type.



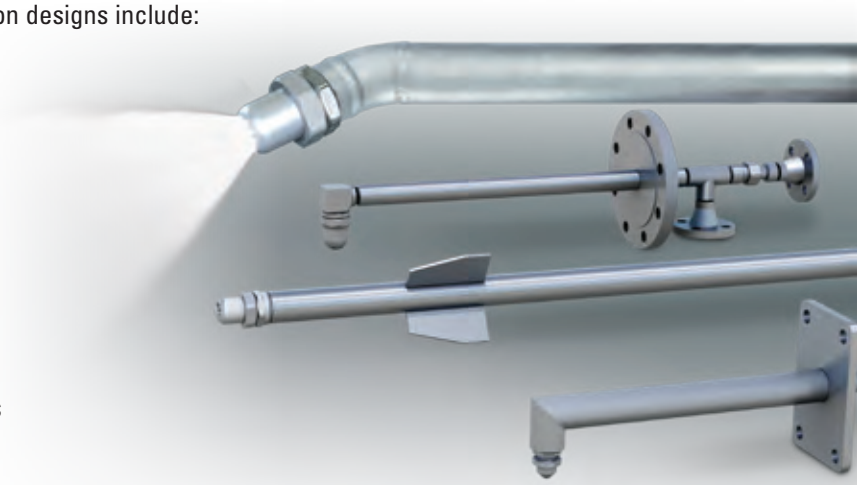
SPRAY HEADER TYPES:

- **Descale headers** – round, square or straight headers designed for high pressure operation
- **Roll cooling headers** – can be equipped with a wide range of nozzles, including different sizes or types on a single header; multi-row headers also available
- **Oiling headers** – options include zone-control, heated, non-heated and recirculating designs
- **Brushless spray headers**
  - PVDF headers equipped with PVDF nozzles for use on pickling lines or prior to galvanizing
  - Stainless steel headers for strip cleaning prior to galvanizing
- **Self-cleaning spray headers with internal rotating brushes** – ideal for use with recirculated or basin water; automatic and manual versions available
- **Laminar flow headers** – standard and slit-style versions are available for efficient, cost-effective cooling

SPRAY LANCES

OVERVIEW:

Spray lances are most commonly used in conjunction with gas cooling nozzles such as our FloMax® nozzles. Typical installation is in ducts, towers and furnaces. Spray lances are built-to-order. The more common designs include:



- 0°, 45° or 90° lance configurations with quick release or bolt-on flanges and optional cooling jackets, purge tubes and protective tubes
- Multiple nozzle lances with inline or nozzles clusters

When solutions are needed to meet challenging physical spaces or hostile environments, we can design and manufacture lances in a wide range of styles including insulated, water- and steam-jacketed, recirculating and retractable, in high-temperature and corrosion-resistant materials. If required, manufacturing to meet local codes is available along with testing in accordance with ANSI® and ASTM® standards.

RELY ON THE INDUSTRY'S HIGHEST QUALITY NOZZLES FOR COOLING STEEL

For consistent, controlled cooling, you'll find the nozzles you need in our full line. Air mist and hydraulic nozzles are available in a wide range of styles, sizes, flow rates, spray angles and spray patterns. If you're running different widths and grades of steel, our CasterJet nozzles can help improve surface quality, reduce air and water consumption and lower maintenance time. For additional cooling and quenching, our FullJet nozzles provide uniform sprays over a wide range of flow rates and pressures. Our technical experts and sales engineers are available around the globe to assist with caster performance evaluation, heat transfer analysis, spray performance testing, special designs to fit on existing equipment and more. **Contact your local steel specialist to learn more.**

CONTINUOUS CASTING

TABLE OF CONTENTS

OVERVIEW: CASTERJET® FLAT SPRAY NOZZLES

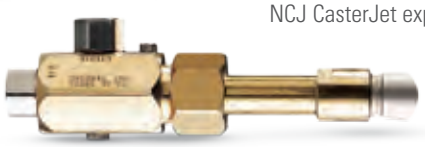
- Specifically designed for highly efficient secondary cooling in the caster
- High heat transfer rates achieved using patented atomization technology to reduce compressed air consumption and lower costs
- Large variety of nozzle configurations to accommodate most space and access requirements
- Wide range of stable spray patterns for controlled zone cooling
- Fine drops evaporate quickly and reduce water build-up under rolls
- Easy tip and tube replacement to minimize downtime when breakouts occur

CASTERJET NOZZLE OPTIONS

50070/50085/56780 NCJ CasterJet nozzles

- Unique mixing process provides uniform spray distribution and even cooling using less water and up to 25% less compressed air. Existing caster lines may be able to turn off some compressors and new lines may require fewer compressors
- Turndown ratio of 25:1 allows flow to be reduced using water pressures as low as 5 psi (.3 bar) without a loss in performance to accommodate a wide range of steel types and allows
- Large free passages allow contaminants to pass through the nozzle
- Ideal for slab and thin slab cooling

NCJ CasterJet exploded view



NCJ CasterJet assembly

56780 NCJ CasterJet body

64010 compact CasterJet nozzles

- Design, performance and benefits comparable to 50070/50085/56780 CasterJet nozzles
- Produces a consistent, uniform drop size distribution across the spray pattern
- Large free passages reduce the risk of clogging
- Ideal for slab cooling in continuous casters with limited frame space or small roll gaps

D40208 block-style CasterJet nozzles

- Compact design permits installation close to slab; spray distance is reduced and cooling efficiency improved
- Positive alignment of spray tip reduces installation errors
- Clog-resistant design
- Ideal for slab cooling

D41968/D41936 anti-pulsing CasterJet nozzles

- Anti-pulsing feature provides constant flow and high heat transfer rates even at low operating pressures
- Uniform water distribution over the entire slab width
- Vertical plate connection simplifies maintenance
- Ideal for slab and beam blank continuous casting

OVERVIEW: FULL CONE, RECTANGULAR AND IMPINGEMENT COOLING NOZZLES

- CasterJet® nozzles
  - – Uniform, stable flows that are unaffected by pressure changes
  - – Low flow operation reduces water use
  - – Large, open flow passages allow contaminants to pass through the nozzles
- D41502 nozzles provide a rectangular spray pattern with large coverage area
- 26010-1/4J nozzles provide softer, impingement-type cooling

FULL CONE, RECTANGULAR AND IMPINGEMENT COOLING NOZZLE OPTIONS

58050 CasterJet nozzles

- Similar design to 50070/50080 CasterJet nozzles with a full cone spray
- Ideal for billet, bloom and pipe continuous casting
- Removable inlets enable quick and easy replacement
- Detachable extension tube allows fast tube and tip replacement

58160 block-style CasterJet nozzles

- Same design as 58050 with a full cone spray in a compact package for areas with minimal space
- Back of nozzle includes O-ring grooves and a threaded or through-hole for mounting
- Available with inlets drilled into the block or threaded inlets for easy cleaning
- Ideal for billet, bloom and pipe continuous casting

D40206 block-style CasterJet nozzles

- Fine droplets in round full cone spray pattern provide effective cooling
- Compact design allows use in areas with limited space
- Ideal for bloom, billet and round continuous casting

FULL CONE, RECTANGULAR AND IMPINGEMENT COOLING NOZZLE OPTIONS

D41502 block-style CasterJet® nozzles

- Use in areas with limited space
- Large rectangular spray coverage
- Reduce use of air and water
- Designed for use in areas with limited space; can be positioned lengthwise as needed
- Ideal for bloom, billet, beam blank and round continuous casting

26010-1/4J impingement style nozzles

- Provides softer cooling – similar to cooling achieved with hydraulic nozzles
- Rings on air cap give visual identification of performance rating to facilitate installation and change out
- Often used in facilities running a small number of steel grades
- Ideal for billet and bloom cooling

OVERVIEW: SPECIALTY COOLING FULLJET® FULL CONE NOZZLES

- Designed specifically for demanding conditions in steel mills. Staked-in vane design won't loosen during caster operation
- More uniform distribution across the entire spray pattern than other full cone nozzles to ensure consistent and controlled cooling
- Spray angle is unaffected by changes in operating pressure allowing for wider variations in casting speeds
- Use different HHCC nozzle sizes to obtain the needed mass water flux; a nominal flow rate increase of 25% at every size increment simplifies flow layout for each segment
- Low profile design is suitable for use on risers in billet casters
- Hex body allows the use of standard sockets for easy installation and removal
- Ideal for use in mini mills and on high-speed continuous casting machines

OVERVIEW: SPECIALTY COOLING RECTANGULAR AND FLAT SPRAY NOZZLES

- Designed specifically for demanding conditions in steel mills; ideal for slab casting
- 25381 spray tips produce a thick, rectangular, uniform pattern and feature a smaller orifice to minimize fluttering and maximize cooling efficiency. Widely used in upper section cooling in slab, billet and bloom casting
- New D41828 spray tips provide similar performance to 25381 spray tips but feature a design optimized for efficient heat transfer
- D41539 rectangular spray tips are ideal for cooling billets and blooms
- VeeJet® XT flat spray nozzles produce an extra-thick spray with a transverse spray angle of 20° and 30° for use with different shapes
- 49784 dovetail spray tips are ideal for roll cooling operations where alignment is critical
- 56862 cross spray nozzles produce an extra heavy edge pattern; ideal for cooling two rolls in a caster with a single nozzle

OVERVIEW: FULL CONE FULLJET® NOZZLES

G and H FullJet nozzles:

- Solid cone-shaped spray pattern with round impact area
- Unique vane design minimizes turbulence and ensures uniform cooling
- Large, unobstructed flow passages minimize clogging
- G, GG, GA and GGA models provide uniform spray distribution from .10 to 13.9 gpm (.38 to 52 lpm) at operating pressures up to 300 psi (20 bar); spray angles from 43° to 94°
- H and HH models provide uniform spray distribution from .10 to 49 gpm (.38 to 183 lpm) at operating pressure up to 300 psi; spray angles from 46° to 94°
- Ideal for cooling billets, blooms and narrow side slab castings

VK FullJet nozzles:

- Solid cone-shaped spray pattern with round impact area
- Uniform spray distribution from .16 to 26.5 gpm (.5 to 89.1 lpm) at operating pressures up to 300 psi (20 bar); spray angles from 45° to 120°
- Ideal for slab cooling

OVERVIEW: SQUARE, OVAL AND VANELESS FULLJET® NOZZLES

G-SQ, GG-SQ, HH-SQ FullJet nozzles:

- Full cone square spray pattern
- Uniform spray distribution from .26 to 37 gpm (1.1 to 140 lpm) at operating pressures up to 150 psi (10 bar); spray angles from 40° to 82°
- Ideal for cooling slabs, billets, and blooms in the upper section after the mold

G-VL, GG-VL and HH-VL FullJet nozzles:

- Full cone oval spray pattern; length is approximately twice its width
- Uniform spray distribution from .59 to 3.2 gpm (2.2 to 11.9 lpm) at operating pressures up to 150 psi (10 bar); spray angles: 80° by 45° to 106° by 64°
- Ideal for cooling slabs, billets, and blooms in the upper section after the mold

GANV and GGANV FullJet nozzles:

- Full cone round spray pattern
- No vane for unrestricted flow – coarse spray is projected at 90° from axis at the inlet
- Uniform spray distribution from .35 to 23 gpm (1.4 to 87 lpm) at operating pressures up to 100 psi (7 bar); spray angles: 68° to 95°
- Ideal for use in cooling applications where clogging is a concern

SPRAY TECHNOLOGY SOLUTIONS FOR EVERY AREA OF YOUR HOT ROLLING MILL

To ensure optimal steel quality, partner with Spraying Systems Co. for superior products and service. Our product offering includes a wide range of nozzles and headers, for descaling, cooling, scale removal and more. In addition, there is a local steel industry expert in your area to help assist with product selection, header and system design, cooling calculations, specialized testing and more. We have a decades-long, proven track record helping mills around the world minimize defects, reduce operating costs and simplify maintenance.
Please let us know how we can help you.

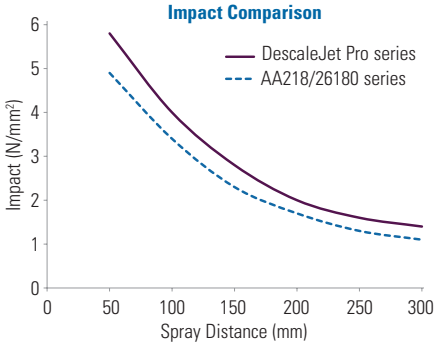
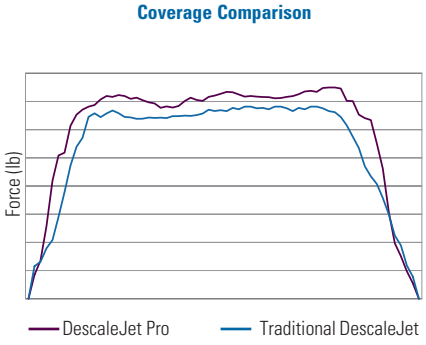
DescaleWare®, our proprietary software, simplifies nozzle selection and header design by using impact and coverage data collected in our spray laboratories. The software determines which nozzles provide the desired performance and graphically displays the optimal header layout including nozzle type, spacing, coverage, spray height, lead angle and impact values.

OVERVIEW: DESCALING NOZZLES

- High-impact descaling for scale-free steel
- Minimize turbulence and maximize impact
- Minimize water and pressure use without compromising performance
- Maximize effective coverage area





DESCALING NOZZLE OPTIONS

DescaleJet® Pro nozzles

- Advanced vane design reduces turbulence while increasing water velocity for improved impact and more effective descaling
- Orifice design produces large effective coverage and enables use of fewer nozzles and eliminates water waste
- Carbide material with finer gain structure reduces material wear and extends service life
- Wide range of threaded and weld connections, stabilizing attachments and tip bodies for easy integration in existing installations
- Ideal for thin strip, slab, plate, rounds and billets

26180/26190 DescaleJet and AA218/AA219 DescaleJet nozzles

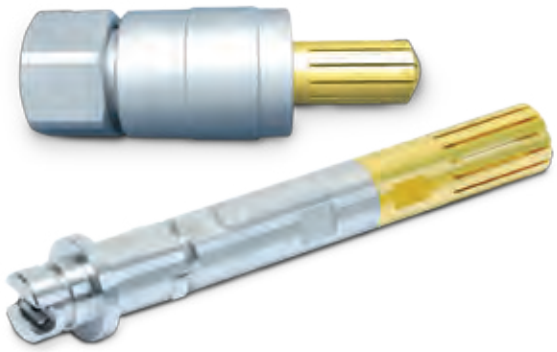
- Internal vane and tight spray pattern increase impact
- Hardened stainless steel or tungsten carbide inserts extend service life
- Stainless steel body and spray tip holder provide protection from splashback wear and flying debris
- Self-aligning spray tips reduce maintenance/replacement time
- Flat seat design of the 26180/26190 series expedites maintenance; an internally threaded cap on AA218/AA219 protects against splashback damage
- 1" inlet connections with choice of threaded or weld bodies
- Ideal for thin strip, slab, plate, rounds and billets

AA214 DescaleJet and Compact DescaleJet nozzles

- When used at spray heights of 2" to 6" (50 to 150 mm) and placed close together on a header, these nozzles provide the same impact level of higher capacity nozzles using less water
- Fluid passages minimize turbulence and produce thin, high-impact sprays
- Tungsten carbide inserts, pressed directly in nozzle bodies, provide long wear life, reduced maintenance time and lower replacement costs
- Choice of threaded and weld connections
- Ideal for thin strip, rounds and billets

HiScaleJet, HSJ and Mini HiScaleJet nozzles

- Comparable performance to AA218/AA219 and 26180/26190 DescaleJet® nozzles but with body styles to match different header designs
- HiScaleJet and Mini HiScaleJet feature a flat seated surface and long alignment flat on the tip body for positive alignment
- HSJ features a flat seating surface and larger and durable alignment lugs at the base of the tip holder
- Ideal for thin strip, slab, plate, rounds and billets



CVCN Check Valves

- Used with DescaleJet Pro nozzles, CVCN check valves prevent water from dripping after descaling and overcooling steel
- Allows faster sequencing of plates – no delays waiting for nozzles to shut off
- Eliminates water hammer effect by reducing nozzle turbulence and controlling turbulence in the header
- Minimizes pressure drop

DESCALING NOZZLE QUICK REFERENCE GUIDE

Model	Flow Rate Range at 2000 psi (138 bar) gpm (lpm)	Max. Operating Pressure psi (bar)	Spray Angle	Orifice Material
DescaleJet® Pro	3.5 to 52 (14 to 196.8) 3.5 to 35 (14 to 140) for Mini DescaleJet Pro	5800 (400) 4350 (300) for Mini DescaleJet Pro	20° to 40° at 2175 psi (150 bar)	Tungsten carbide
26180/26190 and AA218/AA219	5.7 to 52 (21.6 to 196.8)	3000 (207)	15° to 40° at 40 psi (3 bar)	Tungsten carbide or hardened stainless steel
AA214 DescaleJet and Compact DescaleJet	1.4 to 10.6 (5.3 to 40.1)	5800 (400)	18° to 40° at 40 psi (3 bar)	Tungsten carbide
HiScaleJet and HSJ Nozzles	4.2 to 52 (15.9 to 196.8)	4350 (300)	23° to 40° at 2175 psi (150 bar)	Tungsten carbide
Mini HiScaleJet	4.2 to 52 (15.9 to 196.8)	5800 (400)	20° to 40° at 2175 psi (150 bar)	Tungsten carbide

OVERVIEW: VEEJET® NOZZLES

- Flat fan spray patterns available in different styles and a wide range of flow rates and spray angles
- Large coverage area per nozzle reduces the number of nozzles required
- Narrow spray angle nozzles provide focused impact for side sweep applications
- Self-aligning nozzles, ideal for use in headers or manifolds, use a dovetail groove or locating flats to ensure repeatable pattern positioning; available with weld or threaded body connection options
- Ideal for use in roll cooling and interstand cooling

VEEJET NOZZLE OPTIONS

18897 and FSUN-S dovetail spray tips

49803 and 49807 dovetail spray tips

58606 self-aligning spray tip

58600-H3/4U with strainer

VEEJET NOZZLE QUICK REFERENCE GUIDE

Model	Connection/Type	Offset Angle	Flow Rate Range gpm (lpm)	Spray Angle	Materials
18897	Dovetail tip; threaded and weld body options	0°, 5°, 15°, 30°, 45° and 60°	1.0 to 44 (3.2 to 144)	15° to 110° at 40 psi (3 bar)	Brass, 303 stainless steel, hardened stainless steel, PVDF
FSUN-S	Dovetail tip; threaded and weld body options	0°, 5°, 15°	.06 to 109.7 (.2 to 353.6)	20° to 120° at 72 psi (5 bar)	Brass, 303 stainless steel, 316 stainless steel, PVDF
49803 and 49807	Dovetail tip; threaded and weld body options	5°	.05 to 13.6 (.22 to 50.5)	5° to 110° at 40 psi (3 bar)	Brass, 303 stainless steel, 316 stainless steel
58606	Self-aligning tip with locating flats; M body	15°	6.0 to 55.9 (34.2 to 180.2)	15° to 110° at 40 psi (3 bar)	303 stainless steel with brass strainer
58600	M	NA	7.1 to 141 (29 to 539)	50° to 95° at 40 psi (3 bar)	303 stainless steel with brass strainer

OVERVIEW: WASHJET® NOZZLES

- High-impact sprays and high pressure operation ensure optimal cleaning
- Made of 400 series stainless steel to provide longer wear life than traditional VeeJet® nozzles
- Flat spray nozzles provide an even edge fan type spray pattern
- Uniform spray distribution from .10 to 78 gpm (.39 to 290 lpm) by using optional internal guide vane to stabilize liquid turbulence
- Spray angles from 0° (solid stream) to 65° for MEG, WEG and MEG-SSTC; 5° to 80° for IMEG®
- Operating pressures from 300 to 4000 psi (20 to 275 bar)
- MEG-SSTC nozzles have tungsten carbide orifice inserts for maximum erosion resistance
- IMEG nozzles feature a patented design that minimizes turbulence and maximizes impact; higher impact per unit than MEG nozzles
- Ideal for light descaling of billets, blooms or rounds

WASHJET NOZZLE OPTIONS

MEG
1/8" to 1/4" male conn.

WEG
1/8" to 1/4" female conn.

MEG-SSTC
1/4" male conn.

IMEG
1/8" to 1/4" male conn.

WASHJET NOZZLE QUICK REFERENCE GUIDE

Model	Connection/Type	Connection Size (in.)	Materials
MEG	M	1/8 to 1/4	Hardened stainless steel
WEG	F	1/8 to 1/4	
MEG-SSTC	M	1/4	
IMEG	M	1/8 to 1/4	

F = female thread; M = male thread.

OVERVIEW:

FLOODJET® NOZZLES

- Wide angle, deflected type flat fan spray pattern – angles from 73° to 153°
- Uniform spray distribution from .04 to 110 gpm (.14 to 410 lpm)
- Use when nozzles can be mounted horizontally
- Can be used with steam for blow-off applications
- TEK provides a tapered edge spray pattern to eliminate heavy edges while maintaining the wide spray pattern
- Ideal for operations requiring wide coverage such as blowing loose scale off strip

FLATJET® NOZZLES

- Narrow angle, deflected type flat fan spray pattern – angles from 15° to 50°
- Uniform spray distribution from .24 to 39 gpm (.91 to 144 lpm)
- Provides higher impact than other narrow angle nozzles
- Ideal for side sweep

FLOODJET NOZZLE OPTIONS

K
1/8" to 1" male conn.

TEK
1/8" to 1/4" male conn.

FLATJET NOZZLE OPTIONS

P
1/8" to 1/4" male conn.

P
3/8" to 3/4" male conn.

FLOODJET & FLATJET NOZZLE QUICK REFERENCE GUIDE

Model	Connection/Type	Connection Size (in.)	Materials
K	M	1/8 to 1	Brass, 303 stainless steel, 316 stainless steel
TEK	M	1/8 to 1/4	Brass, 303 stainless steel
P	M	1/8 to 3/4	Brass, mild steel, 303 stainless steel, 316 stainless steel

F = female thread; M = male thread.

FloodJet nozzles are also available in quick-connect versions.

FOR DETAILED NOZZLE PERFORMANCE DATA, SEE **spray.com/steelcatalog/sectionC**

OVERVIEW:

H FULLJET® NOZZLES

- Solid cone-shaped spray pattern with round impact area
- Unique vane design minimizes turbulence to ensure uniform spray distribution and consistent spray coverage
- Large unobstructed flow passages minimize clogging
- Flow rates from 5.1 to 3686 gpm (21 to 13953 lpm)
- Ideal for plate cooling

MAXIMUM FREE PASSAGE FULLJET NOZZLES

- Patented vane design provides largest free passage of maximum free passage nozzles; ideal for use with fluids containing particulates
- More uniform spray distribution than other large free passage nozzles
- Uniform spray distribution from 1.4 to 119 gpm (5.3 to 470 lpm)
- Operating pressures up to 80 psi (6 bar)
- Spray angles: 60°, 90° and 115°
- Ideal for cooling slab and strip

FULLJET NOZZLE OPTIONS

H
1-1/4" to 8" female conn.
Removable vane/cast body

HMFP
3/8" to 1-1/2" female conn.

HHMFP
3/8" to 1-1/2" male conn.

FULLJET NOZZLE QUICK REFERENCE GUIDE

Model	Connection/Type	Connection Size (in.)	Materials
H	F, Cast	1-1/4 to 8	Brass, 316 stainless steel
HMFP	F	3/8 to 1-1/2	316 stainless steel vane and choice of brass or 316 stainless steel bodies
	F	1-1/4 to 1-1/2	316 stainless steel vane and 316 stainless steel body
HHMFP	M	3/8 to 1	316 stainless steel vane and choice of brass or 316 stainless steel bodies
	M	1-1/4 to 1-1/2	316 stainless steel vane and 316 stainless steel body

F = female thread; M = male thread.

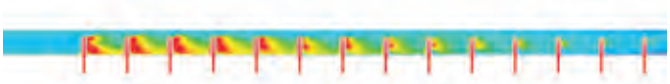
DESCALE HEADERS

OVERVIEW:

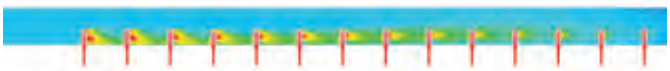
To ensure optimal descaling, we use DescaleWare®, our propriety software, for descale header layout. DescaleWare uses impact and coverage data collected in our spray laboratories to identify the nozzles and header layout that will provide the performance needed for your specific operation.

BENEFITS:

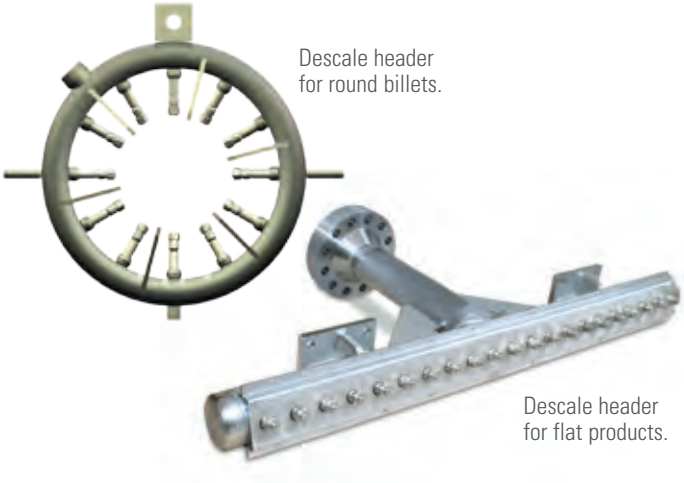
- Ensures headers are properly sized to match performance requirements
- Code compliance as required
- Single-source supply of headers and nozzles eliminates potential integration problems
- CFD modeling available to validate header design and reduce pressure loss and turbulence



This CFD model shows a 4" dia. header with 14 nozzles. The total flow is 743 gpm (2813 lpm) at 2300 psi (159 bar). The model reveals the velocity leading into the first six nozzles exceeds the recommended maximum of 15 ft/s (4.5 m/s). In fact, the entry velocity for the first nozzle is 25.7 ft/s (7.8 m/s).



This model shows what happens when the pipe dia. is increased to 6" and operating conditions remain the same. The entry velocity of the first nozzle is now well below the recommended value at 11.3 ft/s (3.4 m/s).



Descale header for round billets.

Descale header for flat products.

FOR MORE INFORMATION ON HEADER DESIGN AND SPECIFICATION GUIDELINES, SEE **spray.com/steelcatalog/sectionC**

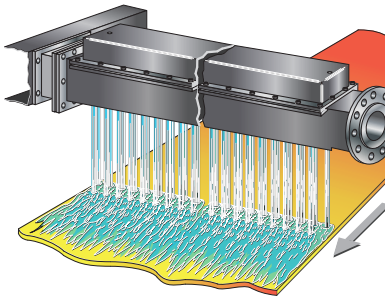
LAMINAR FLOW HEADERS

OVERVIEW:

Laminar flow headers provide consistent and cost-effective sheet cooling on runout tables. Operating at pressures as low as 0.9 psi (0.06 bar), laminar cooling uses water very effectively.

BENEFITS:

- Rod-like column of water from solid stream VeeJet nozzles is superior to U-tube nozzle cooling
- Header does not need to be filled or drained to interrupt the flow pattern enabling simplified header sequencing and reduced lag time
- An internal baffle plate ensures precise flow distribution and simplifies maintenance and replacement
- Slit-style laminar flow headers that produce an evenly distributed curtain-like sheet of water help reduce cracking and other defects



VEEJET® HEADERS

OVERVIEW:

Custom-designed headers equipped with VeeJet flat spray nozzles are ideal for cooling hot strip and plate products. Headers can be designed to allow use of VeeJet nozzles with different spray angles.

BENEFITS:

- Wide range of nozzle sizes, capacities, spray angles and materials
- Compact profile allows close positioning to target to maximize heat removal and extend roll life
- Overlapping patterns provide efficient, uniform cooling
- Suitable for use on runout tables, strip wash and lubrication

SPRAY TECHNOLOGY FOR ALL THE PROCESSES IN YOUR COLD ROLLING MILL

No matter what you need to wash, rinse, lubricate, cool or dry, Spraying Systems Co. has the ideal nozzle for your application. We offer hydraulic and air atomizing nozzles in a thousands of styles and sizes. Our VeeJet flat spray nozzles and headers are widely used in pickling, annealing and galvanizing operations and are available in acid- and corrosion-resistant plastics in addition to metal materials.

For oiling, zinc dip, galvanizing, soft quenching and more, consider our PulsaJet automatic spray nozzles. These unique nozzles provide superior spray performance and can help eliminate common quality problems. PulsaJet nozzles are part of our AccuOil system, which can dramatically reduce over-application of oil on strip, even when line speed changes. Our WindJet product line is ideal for drying and blow-off throughout your mill. Choose from headers and nozzles that use compressed air or air knife packages powered by energy-efficient regenerative blowers.

Contact your local steel specialist for a no-charge consultation to see how we can assist with process optimization and product selection.

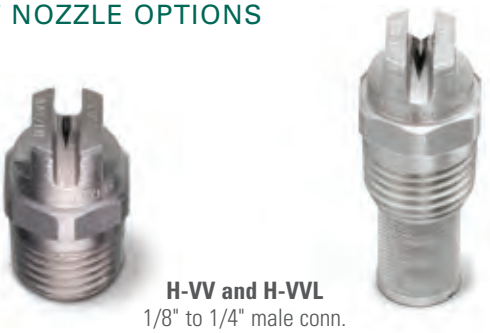
OVERVIEW: VEEJET® NOZZLES

- Flat spray nozzles are ideal for use in spray headers or manifolds, producing a fan-type, tapered-edge spray pattern to ensure even coverage when multiple nozzles are used in a series
- One-piece design
- Spray angles from 0° to 110°
- Uniform spray distribution with flow rates from .012 to 1237 gpm (.047 to 4720 lpm)
- Operating pressures up to 500 psi (35 bar)
- Ideal for use in pickling, annealing, galvanizing and rolling operations

VEEJET NOZZLE OPTIONS



H-VV and H-VVL
1/8" to 1/4" male conn.
Flow rates below 1 gpm at 40 psi (3.8 lpm at 2.8 bar)
H-VVL includes integral strainer

H-DT
1/8" to 1/4" female conn.
Flow rates below 1 gpm at 40 psi
(3.8 lpm at 2.8 bar)

H-DU
1/8" to 1/4" female conn.
Flow rates of 1 gpm and greater at 40 psi
(3.8 lpm and greater at 2.8 bar)

U
1" to 2" male conn.
Flow rates of 40 gpm and greater at 40 psi
(151 lpm and greater at 2.8 bar)

H-U
1/8" to 3/4" male conn.
Flow rates of 1 gpm and greater at 40 psi
(3.8 lpm and greater at 2.8 bar)

OVERVIEW: DOVETAIL SPRAY TIPS

- Flat fan spray pattern; widely use in spray headers
- Dovetail groove feature provides repeatable pattern positioning without an elastomeric seal
- Self-aligning, interchangeable spray tip slides into the groove in the nozzle body ensuring exact alignment body every time the nozzle is reassembled
- Ideal for use in pickling, annealing, galvanizing and rolling operations

DOVETAIL SPRAY TIP OPTIONS

18897 and FSUN-S dovetail spray tips

20799 dovetail spray tip

DOVETAIL SPRAY TIP QUICK REFERENCE GUIDE

Model	Connection/Type	Offset Angle	Flow Rate gpm (lpm)	Spray Angle	Materials
18897	Dovetail tip; threaded and weld body options	0°, 5°, 15°, 30°, 45° and 60°	1.0 to 44 (3.2 to 144)	15° to 110° at 40 psi (3 bar)	Brass, 303 stainless steel, hardened stainless steel, PVDF
FSUN-S	Dovetail tip; threaded and weld body options	0°, 5°, 15°	.06 to 109.7 (.2 to 353.6)	20° to 120° at 72 psi (5 bar)	Brass, 303 stainless steel, 316 stainless steel, PVDF

OVERVIEW: ELECTRICALLY-ACTUATED PULSAJET® HYDRAULIC AND AIR ATOMIZING NOZZLES

- Hydraulic atomizing PulsaJet nozzles use only liquid pressure as the force for atomization; air atomizing PulsaJet nozzles use liquid mixed with compressed air as the atomization force
- Dozens of UniJet® spray tips and air atomizing spray set-ups are available for PulsaJet nozzles in a wide variety of flow rates and spray patterns
- When using a PulsaJet series nozzle and an AutoJet® spray controller, Precision Spray Control (PSC) is achieved:
  - Consistent application rates at varying line speeds
  - Low flow rates comparable to air atomizing nozzles for possible elimination of compressed air in some operations
- Ideal for oiling, zinc dip, galvanizing, soft quenching and more

ELECTRICALLY-ACTUATED PULSAJET HYDRAULIC NOZZLE OPTIONS

AA10000AUH-03
Typical flow range:
0.0017 - 0.47 gpm (0.006 - 1.8 lpm)
Stainless steel, Viton® or EPDM seals, PPS and PEEK
Up to 15,000 cycles per min
Zone 1 use version also available

AA10000AUH-10
Typical flow range:
0.02 - 1.6 gpm (0.075 - 6.1 lpm)
Stainless steel, Viton or EPDM seals, PPS and PEEK
Up to 5,000 cycles per min

AA10000AUH-104210
Rear liquid inlet
Typical flow range:
0.0017 - 0.47 gpm (0.006 - 1.8 lpm)
Stainless steel, Viton or EPDM seals, PPS and PEEK
Up to 15,000 cycles per min
Side liquid inlet version for low profile mounting also available

AA10000AUH-104215
Front port for liquid recirculation
Typical flow range:
0.0017 - 0.47 gpm (0.006 - 1.8 lpm)
Stainless steel, Viton or EPDM seals, PPS and PEEK
Up to 15,000 cycles per min

AA10000AUH-72440-1/4
Jacketed design keeps nozzle and sprayed liquid at a consistent temperature
Typical flow range:
0.0017 - 0.47 gpm (0.006 - 1.8 lpm)
Electropolished or chromium nitride coated magnetic stainless steel, stainless steel, Viton or EPDM seals, PPS and PEEK
Up to 15,000 cycles per min

AA10000AUH-0050
Miniature design for applications with limited space
Typical flow range:
0.0009 - 0.08 gpm (0.003 - 0.30 lpm)
Stainless steel, Viton or EPDM seals, PPS and PEEK Available only as a part of the PulsaJet Mini Low Flow Spray System (with AutoJet spray controller)

OVERVIEW: AIR-ACTUATED AUTOMATIC AIR ATOMIZING NOZZLES

- Compressed air is used to control air cylinder operation for accurate intermittent spraying (up to 180 cycles per minute) and also for liquid atomization
- Wide variety of nozzle bodies is available for convenient mounting and positioning
- Models available with clean-out needles, shut-off needles, swivels and strainers to optimize performance
- Liquid lines can be pressure-fed, siphon-fed or gravity-fed
- Spray set-ups consisting of an air cap and a fluid cap can mix the fluids either internally or externally to produce a fine spray pattern
- Dozens of Drip Free™ air atomizing spray set-ups available for a wide range of flow capacity and spray patterns
- Ideal for zinc dip, galvanizing, soft quenching and more

AIR-ACTUATED AUTOMATIC AIR ATOMIZING NOZZLE OPTIONS

1/4JAU
Flow rates up to 1.2 gpm (4.5 lpm)
Drip Free spray set-ups
provide complete shut-off
Nickel-plated brass or stainless steel

10535-1/4J
Self-contained air cylinder provides
controlled intermittent spraying
Drip Free spray set-ups
provide complete shut-off
Nickel-plated brass or stainless steel

D55500-JAU
Block design 30% smaller
than standard 1/4JAU
Drip Free spray set-ups provide
complete shut-off
Stainless steel

AIR-ACTUATED AUTOMATIC AIR ATOMIZING NOZZLE QUICK REFERENCE GUIDE

Model	Connection Size (in.)	Max Liquid Pressure psi (bar)	Min Air Cylinder Pressure psi (bar)	Max Flow gpm (lpm)	Max Temp Liquid °F (°C)	Max Speed cpm	Spray Set-Ups
1/4JAU	1/4 (air and liquid)	125 (8.6)	30 (2.1)	1.2 (4.5)	400 (204)	180	1/4J set-ups
10535-1/4J	1/4 (air and liquid)	125 (8.6)	30 (2.1)	1.2 (4.5)	400 (204) liquid 150 (66) air	180	1/4J set-ups

OVERVIEW: J AND JJ SERIES AIR ATOMIZING NOZZLES

- Liquid and compressed air enter the nozzle body and are mixed by the spray set-up to produce a finely atomized spray pattern
- Spray set-ups, consisting of an air cap and a fluid cap, can mix the fluids either internally or externally
- Hundreds of spray set-ups are available to produce cone and flat spray patterns
- A wide variety of nozzle bodies are available for convenient mounting and positioning
- JJ compact nozzle bodies are available for applications where space is limited
- Models available with clean-out needles, shut-off needles swivels and strainers to optimize performance
- Ideal for zinc dip, galvanizing, soft quenching and more

J AND JJ SERIES AIR ATOMIZING NOZZLE OPTIONS

1/8J and 1/4J nozzles
Flow rates up to 72 gph (273 lph)
Liquid and air inlets on opposing sides
Removable plug so needle assemblies can be added
Nickel-plated brass or stainless steel

1/8JJ series nozzles
Compact version of 1/4J
Flow rates up to 33 gph (126 lph) in various spray patterns
Liquid and air inlets on opposing sides
Removable plug so needle assemblies can be added
Nickel-plated brass or stainless steel

AIR ATOMIZING NOZZLE QUICK REFERENCE GUIDE

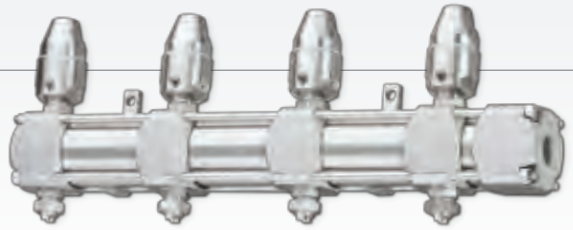
AUTOMATIC AND AIR ATOMIZING NOZZLE HEADERS

OVERVIEW:

Headers equipped with automatic hydraulic or air atomizing nozzles are ideal for applications requiring zone control. A PLC equipped with AutoJet® precision spray control drivers automatically adjust sprays as needed to accommodate multiple strip widths. For air atomizing nozzles, options include block-style and standard headers.



Block manifold

63600 manifold

WINDJET® AIR KNIFE PACKAGES

OVERVIEW:

- Powered by a rugged, regenerative blower; no compressed air required. Costs can be reduced by 95% or more
- A uniform high volume, constant heated air stream is produced along the entire edge of the knife eliminating spotting problems
- Low operating noise
- Large application area
- Packages are customized based on application
- Use when velocity is needed or the oil in compressed air is causing quality problems
- Knife lengths of 6", 12", 18", 24", 30" and 36" (152, 305, 457, 610, 762 and 914 mm)
- Air slot sizes of .040" and .060" (1 and 1.5 mm)
- Aluminum and 316 stainless steel material options
- Blower assemblies: 5.5, 10, 20, 25 and 30 Hp (4.1, 7.5, 14.9, 18.6, 22.3 kW). Include pressure relief valve, pressure gauge, air inlet filter, filter monitoring gauge, fittings, mounting adapter for flexible or rigid tubing
- Ideal for drying cut sheet and rolls and debris removal

Regenerative blower assemblies available in wide range of horsepower and air knife lengths

WINDJET® COMPRESSED AIR NOZZLES

OVERVIEW:

- Economical alternative to drilled pipe
  - – Air nozzles use compressed air use 25% to 35% less air than open pipe
  - – Low flow air knives use 89% to 92% less air than open pipe
  - – Air amplifiers use 75% to 90% less air than open pipe
- Perceived noise reductions ranging from 28% to 60% less than open pipe
- Improved worker safety
- AA727 nozzles produce controlled flat fan air pattern for uniform distribution
- AA707 nozzles produce tightly directed round spray pattern and feature color-coded aluminum caps for easy flow rate identification
- Y767 nozzles feature a short profile – less than half the height of the AA727
- Ideal for drying cut sheet and rolls and debris removal

AA727 WindJet nozzles
1/4" male or female conn.
Polyphenylene sulfide, aluminum, ABS plastic or 303 stainless steel

AA707 WindJet nozzles
1/4" male conn.
Polyphenylene sulfide, PVDF, aluminum, ABS plastic or 303 stainless steel

Y767 Compact WindJet Nozzles
1/4" male conn.
ABS plastic or 303 stainless steel

WINDJET COMPRESSED AIR LOW FLOW AIR KNIVES AND AIR AMPLIFIERS

OVERVIEW:

- Low flow air knives provide a uniform, high velocity air flow across the entire length of the knife with no temperature increase
- Air amplifiers deliver a targeted high-volume, high velocity amplified air stream

WindJet low flow air knives
3", 6", 12", 18" and 24"
(8, 15, 30, 46 and 61 cm) lengths
Aluminum or 316 stainless steel
Shim sets available to adjust air force and flow

WindJet air amplifiers
1/8" to 1/2" female conn.
Aluminum and 316 stainless steel material options

UNIJET® AIR NOZZLES

OVERVIEW:

- Blow-off spray tips specifically designed for use with air and steam to deliver a wide, uniform spray

UniJet blow-off nozzle
1/8" to 3/8" conn.
Brass or 303 stainless steel

LU-VK AIR NOZZLES

OVERVIEW:

- Round high-performance, multi-orifice air nozzle
- One-piece, compact design is well-suited for use in confined areas

LU-VK air nozzle
1/2" to 3/4" female conn.
Brass or 303 stainless steel

AIR NOZZLE HEADERS

OVERVIEW:

WindJet air nozzles can be mounted on a header to ensure uniform coverage of the target area. Standard manifolds are available with 4 to 30 nozzles. Impact can be increased from moderate to very high with a simple operating pressure adjustment.

ACCUOIL™ SYSTEM

OVERVIEW:

The AccuOil system enables precise, uniform application of oil on strip and reduces waste and quality problems. The system uses Precision Spray Control (PSC) to ensure the proper volume of oil is applied consistently, even when line speed changes and sheet width varies. Electrically-actuated hydraulic PulsaJet® nozzles mounted on headers and are controlled by a PLC equipped with AutoJet® PSC drivers. The need for compressed air is eliminated and only the nozzles required to cover the strip width are activated to spray, eliminating oil waste and hazardous overspray.

BENEFITS:

- Reduced scrap – uniform coverage across the entire strip eliminates scrap and costly rework
- Consistent application even when line speed changes
- Lower operating costs – reduces oil consumption, eliminates compressed air
- Reduced maintenance time – reduces messy, dangerous oil to remove from equipment and floors
- Flexible configurations – choose from heated versions with recirculating header and non-heated systems with standard header. Both versions are available with one or two channels
- Ideal for cold and temper mills

spray.com/steelcatalog/sectionD

SPRAY HEADERS

OVERVIEW:

Spray headers are available for a wide range of operations including cooling, cleaning strip before galvanizing and high-pressure rinsing in pickling operations. Headers are built-to-order to optimize nozzle performance and easily integrate into existing lines.

BENEFITS:

Brushless headers

- Basic, effective and economical
- For use with fresh water and operations where nozzle clogging is unlikely
- Use with self-cleaning nozzles when brushes are not desirable
- Available in PVDF and stainless steel

Brush headers

- An internal rotating brush assembly sweeps debris away from nozzles without shutting the system down
- Brushes scrub the interior wall of the header as well as the nozzle orifices, removing accumulated debris in a matter of seconds
- Debris is discharged through a flush-out valve
- Manually-operated brush headers use a handwheel for brush rotation
- Automatic spray headers are equipped with geared drive unit, smart motor and optional timer control

SLIT LAMINAR FLOW HEADERS

OVERVIEW:

The ultra-thin, uniform, continuous sheet of water or air produced by our laminar flow headers improves cleaning and drying in a wide range of operations and provides operating flexibility.

BENEFITS:

- Vertical sheet of liquid or air can be sprayed upward or downward
- Slit widths from .004" to .06" (.1 to 1.6 mm)
- Lengths from 2" to 118" (50 to 3000 mm)
- Flow rate range: 2 to 350 gpm (8.5 to 1325 lpm)
- Dual function operation works with both water and air, eliminating the need for two separate systems
- 304 or 316 stainless steel, PVC or CPVC

PRODUCT SOLUTIONS AND THE EXPERTISE TO ACHIEVE SUPERIOR PERFORMANCE

We have a full range of nozzles and systems for your iron and steelmaking requirements. Just as importantly, we have the services and test equipment to help optimize performance in critical operations such as sinter, coke, electrode and gas cooling and more.

In order to accurately predict performance in a customer's environment, we often use Computational Fluid Dynamics (CFD) modeling. Common uses for CFD include the determination of the best drop size for gas cooling and conditioning and the ideal placement of nozzles and lances in the furnace, cooling tower or other process vessel.

In dust suppression and fire control applications, we often head to our state-of-the-art test laboratories. Drop velocity and distribution studies conducted in our wind tunnel are widely used to simulate the conditions where the nozzles will be used to verify the expected performance can be achieved.

OVERVIEW: FLOMAX® NOZZLES

- Patented multi-stage atomization process produces very small drops using less compressed air than other nozzles
- High turndown ratio for maximum operating flexibility
- Large free passages reduce the risk of clogging and enable the use of lower quality water sources
- Anti-bearding nozzles feature a patented air cap design that resists material buildup near nozzle orifices and prevents performance problems
- Standard and made-to-order lances are also available in a wide range of materials and configurations
- Ideal for evaporative gas cooling and sinter cooling

OVERVIEW: J SERIES NOZZLES

- J Series nozzles consist of a nozzle body and spray set-up
- Standard bodies have liquid and air inlets on opposing sides of the nozzle bodies. Nozzle bodies include a removable plug so needle assemblies can be added in the future. Additional body styles available for 1/2J
- 1/2J nozzles are available with a variety of spray set-ups and flow rates up to 306 gph (1158 lph) in various spray patterns
- 1J nozzles are also available with several spray set-ups and flow rates up to 29 gpm (110 lpm) in various spray patterns
- Ideal for dust suppression and some gas cooling operations

J SERIES NOZZLE OPTIONS

1/2J

1/2JN
Manual shut-off needle to stop liquid flow

1/2JCO
Manual clean-out needle to clear obstructions from the fluid orifice

OVERVIEW: FULLJET® NOZZLES

- Solid cone-shaped spray pattern with round impact area
- Vane design minimizes fluid turbulence to ensure uniform spray distribution and consistent spray coverage
- H and HF nozzles provide uniform distribution from 5.1 to 5324 (35 to 19842 lpm)
- DistriboJet® R, RF and RR extra large free passage versions eliminate clogging, provide uniform spray distribution from 27 to 8728 gpm (122 to 32530 lpm), and are available in six different spray angles ranging from 50° to 95°
- Maximum free passage (MFP) versions provide the largest free passage of nozzles of this type and uniform spray distribution from 50 to 582 gpm (191 to 2282 lpm)
- Ideal for gas cooling, coke cooling, sinter cooling, fire control, and dust control

FULLJET NOZZLE OPTIONS

H
1-1/4" to 8" female conn.

FOR DETAILED NOZZLE PERFORMANCE DATA, SEE **spray.com/steelcatalog/sectionE**

OVERVIEW: UNIJET® NOZZLES

- Quick-connect nozzles reduce maintenance time – bodies remain on pipe/header
- Save on nozzle replacement costs – bodies can be reused, only spray tips are replaced; tips fit on male or female bodies
- Solid cone-shaped spray pattern with round impact area or cone-shaped spray pattern with square-like impact area for coverage of rectangular areas or spray zones
- Spray angles: Standard – 43° to 91°
- Uniform spray distribution from .08 to 7.4 gpm (.3 to 28 lpm)
- Operating pressures up to 300 psi (20 bar)
- Ideal for dust control

FOR DETAILED NOZZLE PERFORMANCE DATA, SEE **spray.com/steelcatalog/sectionE**

OVERVIEW: WHIRLJET® NOZZLES

- Hollow cone spray pattern with a circular impact area
- Large, unobstructed flow passages minimize clogging
- Good atomization of liquids at lower pressures
- Removable caps for easy inspection and cleaning on some models
- Slope-bottom design models reduce the drilling effect of the fluid vortex in the fluid chamber and premature wear
- AX and BX nozzles form smaller drops and operate at flow rates from .03 to .38 gpm (.19 to 145 lpm)
- CX and CF nozzles feature higher flow rates – 4.4 to 2362 gpm *17.1 to 9010 lpm)
- E nozzles offer extra wide spray angle and provide flow rates from .20 to 16.8 gpm (.76 to 64 lpm)
- BD nozzles have a lower profile and provide flow rates from 11 to 38 (41 to 145 lpm)
- Ideal for gas cooling and dust control

AUTOJET® GAS COOLING SYSTEMS

OVERVIEW:

AutoJet Gas Cooling Systems provide effective emission control using closed-loop control of all automated spray system components – nozzles, pumps, sensors and other hydraulic and pneumatic components – to simplify and streamline the gas cooling process. They can be used with a wide range of nozzles including our standard and anti-bearding FloMax® nozzles.

BENEFITS:

- Precise control of gas temperature enables increased production and improved operating efficiency
- Automated control of spray nozzles optimizes performance, reduces energy costs
- Closed-loop control ensures precise cooling even with variable operating conditions
- Total control of all system components minimizes the need for operator involvement
- If system cannot make a needed adjustment based on operating conditions, operators are notified via alarms
- Total solution from a single source eliminates integration problems and the hassles of working with multiple vendors

Note: System availability may vary by region. Contact your local steel specialist for assistance.

PLACING YOUR ORDER

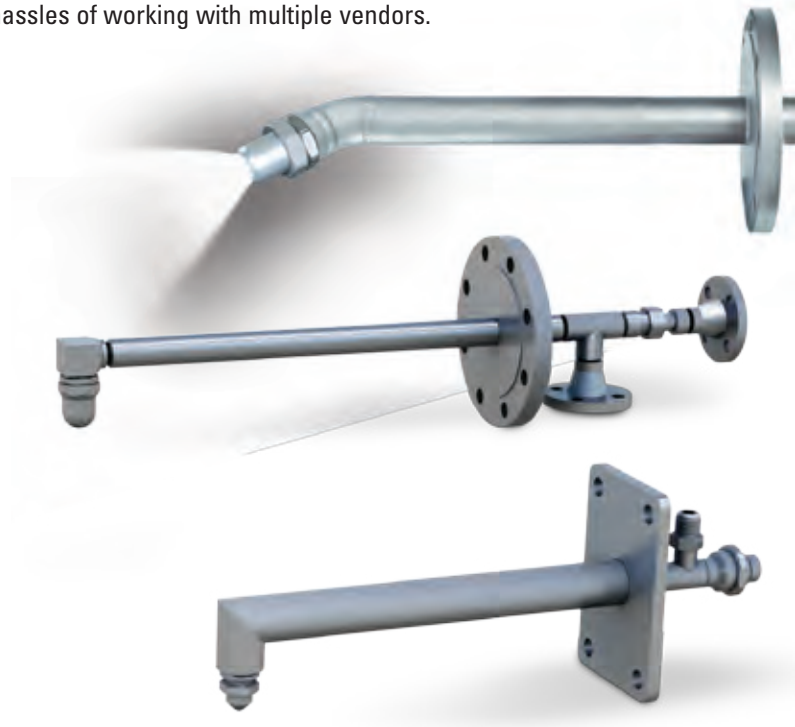
Call your local steel specialist for application assistance or to place an order.

SPRAY LANCES

We provide a wide range of design, fabrication and testing services for spray lances:

- Assistance with lance design, placement in the gas stream and spray direction
- Computational Fluid Dynamics (CFD) modeling to determine how the injected fluid interacts with the receiving stream to validate performance
- Manufacturing to meet a wide range of code requirements
- Spray and flow testing, radiographic, ferrite weld, ultrasonic examination and more

Spray lances can be controlled by AutoJet Gas Cooling Systems for automatic adjustment of spray performance based on operating conditions. In addition, a total solution from a single source eliminates integration problems and the hassles of working with multiple vendors.



MORE INFORMATION ON SPRAY LANCES:
SEE SECTION A

TECHNICAL REFERENCE

TABLE OF CONTENTS

KEY CONSIDERATIONS IN SPRAY NOZZLE SELECTION AND PERFORMANCE OPTIMIZATION

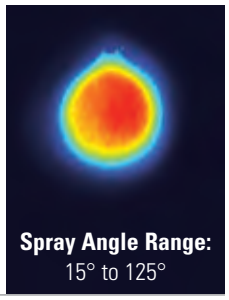
Spray nozzles are precision components designed to yield very specific performance under specific conditions. To help you determine the best nozzle type for your application, the following chart summarizes the performance that each nozzle type is designed to deliver. Visit **youtube.com/sprayingsystems** for video demonstrations of spray patterns.

LASER SHEET IMAGE

FULL CONE NOZZLES

- Uses a unique internal vane design to produce a solid cone-shaped spray pattern
- Spray pattern consists of medium- to large-sized drops

Typical applications:
- Metal cooling
- Washing/rinsing
- Dust control
- Fire control
- Coating



Spray Angle Range: 15° to 125°

FULL CONE (SPIRAL-TYPE) NOZZLES

- Produces a solid cone-shaped spray pattern when the fluid exits the voids in the spiral
- Spray pattern is not as uniform as full cone nozzles with an internal vane
- Spray pattern consists of relatively coarse drops

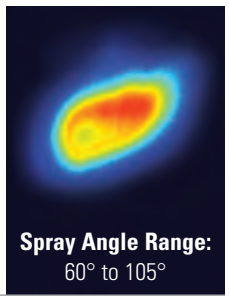
Typical applications:
- Quenching
- Dust control
- Fire control
- Flue gas desulfurization (FGD)

Spray Angle Range: 50° to 170°

FULL CONE (OVAL SPRAY) NOZZLES

- Uses a unique internal vane to produce a solid cone-shaped spray pattern with oval impact area with a width approximately one-half its length
- Spray pattern consists of medium- to large-sized drops

Typical applications:
- Metal cooling
- Air/gas washing
- Dust control
- Fire control

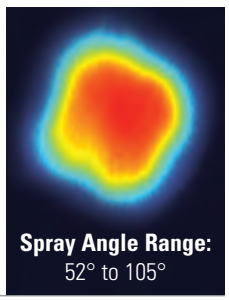


Spray Angle Range: 60° to 105°

FULL CONE (SQUARE SPRAY) NOZZLES

- Uses a unique internal vane to produce a solid cone-shaped spray with square impact area
- Spray pattern is uniform across entire spray area
- Spray pattern consists of medium- to large-sized drops

Typical applications:
- Metal cooling
- Air/gas washing
- Dust control
- Fire control



Spray Angle Range: 52° to 105°

NOTE: The spray pattern images on the right were acquired in our spray laboratories using Laser Sheet Imaging (LSI). LSI images are collected by passing a laser sheet through a cross-section of the spray plume and imaging with a light-filtered camera. The distributions are directly proportional to the surface area distribution of the sprayed material (red: high, blue: low, black: zero). Volume distributions typically are similar to surface area distributions for these nozzles, depending on the local drop size distributions.

LASER SHEET IMAGE

FLAT (EVEN) NOZZLES

- Provides even distribution of medium-sized drops throughout the thin, rectangular spray pattern
- When used on a header, nozzles are positioned for edge-to-edge pattern contact

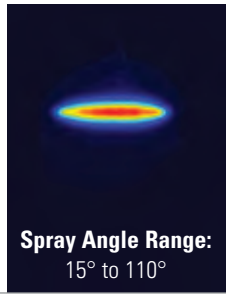
Typical applications:
- Descaling
- Metal cooling
- Washing/cleaning
- Coating

Spray Angle Range: 25° to 65°

FLAT SPRAY (TAPERED) NOZZLES

- Produces a tapered-edge flat spray pattern
- Used on spray headers to provide uniform coverage as a result of overlapping distributions

Typical applications:
- Descaling
- High-pressure cleaning
- Metal cooling

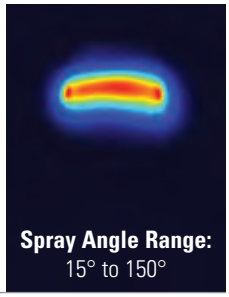


Spray Angle Range: 15° to 110°

FLAT SPRAY (DEFLECTED-TYPE) NOZZLES

- Uses a deflector surface to form an even flat spray pattern consisting of medium-sized drops
- Large free passage design reduces clogging through the round orifice

Typical applications:
- Washing/cleaning
- Debris removal

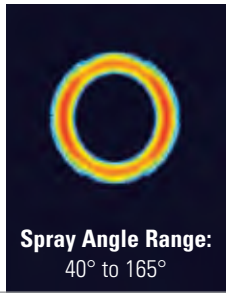


Spray Angle Range: 15° to 150°

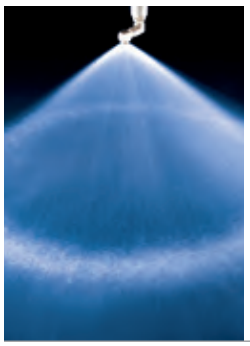
HOLLOW CONE (WHIRLCHAMBER-TYPE) NOZZLES

- Uses a whirlchamber to rotate the fluid and produce a circular spray pattern
- Ideal for use when a combination of small drop size and higher capacity is needed

Typical applications:
- Air, gas and water cooling
- Dust control
- Flue gas desulfurization (FGD)
- Cooling products on conveyors
- Water aeration



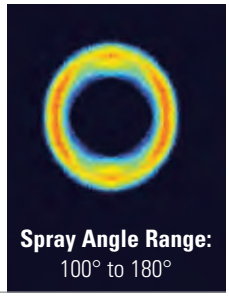
Spray Angle Range: 40° to 165°



HOLLOW CONE (DEFLECTED-TYPE) NOZZLES

- Uses a deflector cap to form an umbrella-shaped hollow cone pattern

Typical applications:
- Dust control
- Fire control
- Flush cleaning of tube/pipe interiors



Spray Angle Range: 100° to 180°

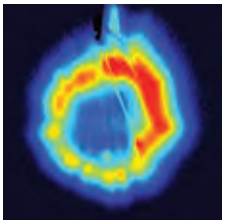
LASER SHEET IMAGE

HOLLOW CONE (SPIRAL-TYPE) NOZZLES

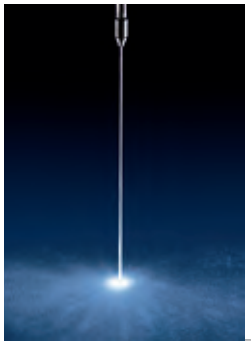
- Produces a circular spray pattern when the fluid exits the voids in the spiral
- Drops are slightly coarser than those in other hollow cone sprays
- Provides a high flow rate in a compact nozzle size
- One-piece design produces maximum throughput for a given pipe size

Typical applications:

- Dust control
- Fire control
- Flue gas desulfurization (FGD)



Spray Angle Range
50° to 180°

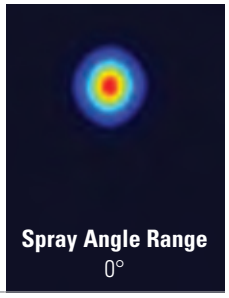


SOLID STREAM NOZZLES

- Produces a solid stream spray with the highest impact per unit area

Typical applications:

- Laminar flow operations
- Washing/cleaning



Spray Angle Range
0°

ATOMIZING (HYDRAULIC, FINE MIST) NOZZLES

- Produces a finely atomized, low capacity spray in a hollow cone pattern without use of compressed air

Typical applications:

- Evaporative cooling
- Dust control
- Coating

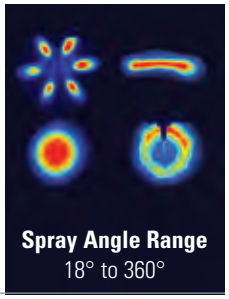
Spray Angle Range
35° to 165°

AIR ATOMIZING AND AIR ASSISTED NOZZLES

- Produces a variety of cone and flat spray patterns through atomization of liquid by compressed air
- Internal mix impingement atomization forms very fine drops

Typical applications:

- Evaporative cooling
- Coating
- Metal cooling



Spray Angle Range
18° to 360°

NOTE: The spray pattern images on the right were acquired in our spray laboratories using Laser Sheet Imaging (LSI). LSI images are collected by passing a laser sheet through a cross-section of the spray plume and imaging with a light-filtered camera. The distributions are directly proportional to the surface area distribution of the sprayed material (red: high, blue: low, black: zero). Volume distributions typically are similar to surface area distributions for these nozzles, depending on the local drop size distributions.

CAPACITY – FLUID CAPACITY FOR HYDRAULIC NOZZLES VARIES WITH SPRAYING PRESSURE

The relationship of pressure and flow with a given orifice is:

$$\frac{Q_1}{Q_2} \sim \frac{(P_1)^n}{(P_2)^n}$$

Q = Flow Rate (in gpm or lpm)
P = Liquid pressure (in psi or bar)
n = Flow exponent

To approximate any unknown flow or pressure, use this formula when the other variables are known. The "n" exponent is used to approximate the ratio of pressure to flow based on the type of spray pattern.

Example:

To determine the flow rate of water for a 1/4G-10 standard full cone nozzle at 150 psi (10 bar), consult the performance charts in this catalog.

You will find that:

- The spray angle is 65°
- Flow (Q_1) at 40 psi = 1.9 gpm
- Pressure (P_1) = 40 psi
- Pressure (P_2) = 150 psi

Solving for Q_2 = 3.5 gpm

$$Q_2 = \frac{Q_1}{(P_1/P_2)^n} = \frac{1.9 \text{ gpm}}{(40/150)^{.46}}$$

- The spray angle is 65°
- Flow (Q_1) at 3 bar = 7.5 lpm
- Pressure (P_1) = 3 bar
- Pressure (P_2) = 10 bar

Solving for Q_2 = 13 lpm

$$Q_2 = \frac{Q_1}{(P_1/P_2)^n} = \frac{7.5 \text{ lpm}}{(3/10)^{.46}}$$

FLOW EXPONENT FOR SPECIFIC HYDRAULIC NOZZLE TYPES

Nozzle Type	Exponent "n"
Flat Spray Nozzles – All Full cone Nozzles – Vaneless, 15° and 30° Series Hollow Cone Nozzles – All Solid Stream Nozzles – All Spiral Nozzles – All	.50
Full Cone Nozzles – Standard, Square, Oval and Large Capacity	.46
Full Cone Nozzles – Wide Spray and Wide Square Spray	.44

Visit spray.com/sprayware for online flow rate and spray coverage calculators.

SPECIFIC GRAVITY

All capacity tabulations in this catalog are based on water. Since the specific gravity of a liquid affects its flow rate, tabulated catalog capacities must be multiplied by the conversion factor that applies to the specific gravity of the liquid being sprayed as explained below.

Specific gravity is the ratio of the density of a fluid compared to the density of water. The specific gravity of water is defined as 1. When spraying fluids other than water, specific gravity must be considered in the flow calculations.

$$Q_2 = Q_1(\text{water}) \times \frac{1}{\sqrt{SG}}$$

Using the previous example:

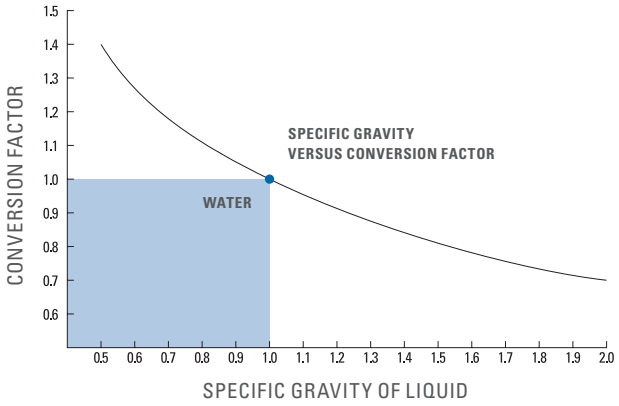
- Fluid sprayed is heavier than water and has a specific gravity of 1.4
- Flow of water at 150 psi = 3.5 gpm
- Heavy fluid (Q_2) = Q_1(water)*1/√1.4

$$Q_2 = \frac{3.5 \text{ gpm} * 1}{\sqrt{1.4}} = 2.95 \text{ gpm}$$

- Fluid sprayed is heavier than water and has a specific gravity of 1.4
- Flow of water at 10 bar = 13 lpm
- Heavy fluid (Q_2) = Q_1(water)*1/√1.4

$$Q_2 = \frac{13 \text{ lpm} * 1}{\sqrt{1.4}} = 11 \text{ lpm}$$

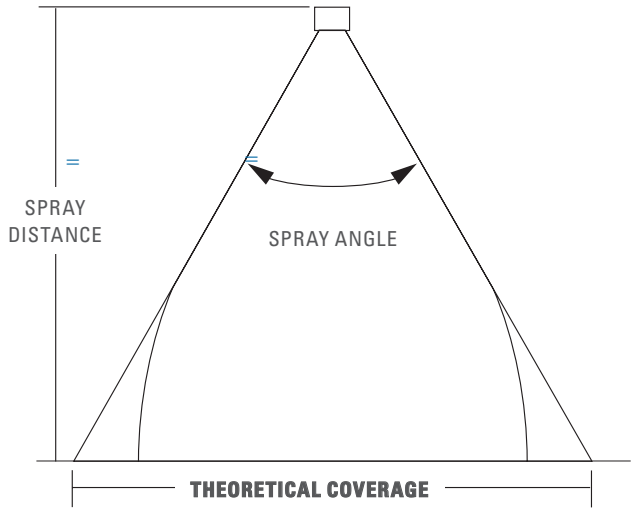
SPECIFIC GRAVITY VERSUS CONVERSION FACTOR



KEY: Conversion factor multiplied by the capacity of the nozzle when spraying water gives the capacity of the nozzle when spraying a liquid with a specific gravity corresponding to the conversion factor. This conversion factor accounts only for the effect of specific gravity on capacity and does not account for other factors affecting capacity.

SPRAY ANGLE AND COVERAGE

Tabulated spray angles indicate approximate spray coverage based on spray or distribution of water. In actual spraying, the effective spray angle varies with spray distance. Liquids more viscous than water form relatively smaller spray angles (or even a solid stream), depending upon viscosity, nozzle capacity and spraying pressure. Liquids with surface tensions lower than water will produce relatively wider spray angles than those listed for water. This table lists the theoretical coverage of spray patterns as calculated from the included spray angle of the spray and the distance from the nozzle orifice. Values are based on the assumption that the spray angle remains the same throughout the entire spray distance. In actual practice, the tabulated spray angle does not hold for long spray distances. If the spray coverage requirement is critical, request data sheets for specific spray coverage data.



Example: A spray nozzle with an angle of 65° spraying 15" (39 cm) from the target provides 19.2" (48.8 cm) of coverage

THEORETICAL SPRAY COVERAGE AT VARIOUS DISTANCES IN INCHES (CM) FROM NOZZLE ORIFICE

Spray Angle	2 in.	5 cm	4 in.	10 cm	6 in.	15 cm	8 in.	20 cm	10 in.	25 cm	12 in.	30 cm	15 in.	40 cm	18 in.	50 cm	24 in.	60 cm	30 in.	70 cm	36 in.	80 cm	48 in.	100 cm

SPRAY DROP SIZE (ATOMIZATION)

Drop size refers to the size of the individual spray drops that comprise a nozzle's spray pattern. Each spray provides a range of drop sizes; this range is referred to as drop size distribution. Drop size distribution is dependent on the spray pattern type and varies significantly from one type to another. The smallest drop sizes are achieved by air atomizing nozzles while the largest drops are produced by full cone hydraulic spray nozzles.

ACTUAL DROP SIZES

· 500 µm

• 1200 µm

5500 µm

One inch = 25,400 µm
One millimeter = 1,000 µm
µm = micrometers

Liquid properties, nozzle capacity, spraying pressure and spray angle also affect drop size. Lower spraying pressures provide larger drop sizes. Conversely, higher spraying pressures yield smaller drop sizes. Within each type of spray pattern the smallest capacities produce the smallest spray drops, and the largest capacities produce the largest spray drops.

DROP SIZE BY SPRAY PATTERN TYPE AT VARIOUS PRESSURES AND CAPACITIES

Spray Pattern Type	10 psi (0.7 bar)			40 psi (2.8 bar)			100 psi (7 bar)		
	Capacity		VMD	Capacity		VMD	Capacity		VMD
	gpm	lpm	microns	gpm	lpm	microns	gpm	lpm	microns
Air Atomizing	.005 .02	.02 .08	20 100	.008 8	.03 30	15 200	12	45	400
Fine Spray	.22	.83	375	.03 .43	.1 1.6	110 330	.05 .69	.2 2.6	110 290
Hollow Cone	.05 12	.19 45	360 3400	.10 24	.38 91	300 1900	.16 38	.61 144	200 1260
Flat Fan	.05 5	.19 18.9	260 4300	.10 10	.38 38	220 2500	.16 15.8	.61 60	190 1400
Full Cone	.10 12	.38 45	1140 4300	.19 23	.72 87	850 2800	.30 35	1.1 132	500 1720

Based on a sampling of nozzles selected to show the wide range of possible drop sizes available.

DROP SIZE TERMINOLOGY

Terminology is often a major source of discrepancy and confusion in understanding drop size. To accurately compare drop sizes from one nozzle to another, the same diameters have to be used. Drop size is usually expressed in microns (micrometers). Following are the most popular characteristic diameters and their definitions.

VOLUME MEDIAN DIAMETER (VMD)
also expressed as $\mathbf{D_{V0.5}}$ and Mass Median Diameter (MMD)

A means of expressing drop size in terms of the volume of liquid sprayed. The Volume Median Diameter drop size when measured in terms of volume (or mass) is a value where 50% of the total volume of liquid sprayed is made up of drops with diameters larger than the median value and 50% with smaller diameters.

SAUTER MEAN DIAMETER (SMD)
also expressed as $\mathbf{D_{32}}$

A means of expressing the fineness of a spray in terms of the surface area produced by the spray. The Sauter Mean Diameter is the diameter of a drop having the same volume-to-surface area ratio as the total volume of all the drops to the total surface area of all the drops.

NUMBER MEDIAN DIAMETER (NMD)
also expressed as $\mathbf{D_{N0.5}}$

A means of expressing drop size in terms of the number of drops in the spray. This means that 50% of the drops by count or number are smaller than the median diameter and 50% of the drops are larger than the median diameter.

More drop size data is available on all types of spray nozzles. For more information, contact your local steel specialist.

IMPACT

Impact is the measure of force imparted on a surface by a spray pattern at a given distance. It can be expressed in several ways. All definitions are derived from the most basic equation of total impact force. This is the force that any flow, at any pressure, is capable of making on a surface. This does not account for orifice shape, nozzle type, fluid properties and other factors.

$$I = K \times Q \times \sqrt{P}$$

Total theoretical impact = constant (based on units) x flow (at pressure P) x square root of pressure (P)

I = total theoretical spray impact

K = constant

Q = flow rate

P = liquid pressure

I	lbs.(f)	kg(f)	Newtons	Newtons
K	.0526	.024	.24	.745
Q	gpm	lpm	lpm	lpm
P	psi	kg/cm^2	bar	MPa

The constant (K), is a unit conversion based on the measurement system used. The conversions are listed in the chart above.

Example:

$I = .0526 \times 10.5 \text{ gpm} \times \sqrt{2500 \text{ psi}}$

I = 27.6 lbs(f)

Contact your local steel specialist for assistance in determining impact in your application.

FACTORS THAT AFFECT IMPACT

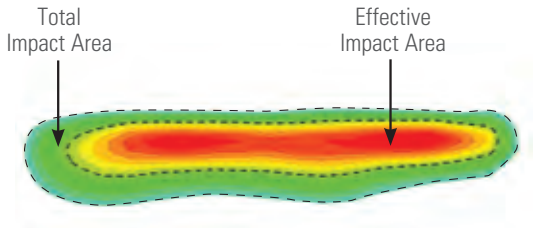
- Loose material and standing liquid both dissipate some portion of the flow energy and can reduce impact
- As spray travels through the air to reach the target surface, drops decelerate and the momentum of the spray is reduced. Nozzle size, pressure, spray style and spray height each play a role in deceleration
- Closer target distances result in higher normalized impact pressure, but also result in smaller coverage area per nozzle
- Increasing pressure will increase total impact. Changes in impact also affect the spray pattern and increase turbulence
- Turbulence has a negative effect on nozzle performance, the service life of the nozzle and header

LATERAL IMPACT AND SPECIFIC IMPACT

Lateral impact, sometimes called lineal impact, is the force per unit length across the spray width. Usually expressed in lb./in. or kg/cm, it shows the volumetric distribution pattern and the evenness of the impact across the spray. It also provides an indication of relative cleaning effectiveness. Flat spray patterns have fairly uniform impact distribution across the effective spray coverage.

Specific impact is the total impact force divided by a given area. Because spray patterns have both an effective impact area, where the majority of the spray hits, and a somewhat larger total impact area, two types of specific impact can be calculated.

- **Average specific impact** is the total impact force divided by the total impact area
- **Maximum specific impact** is the total impact force divided by the effective impact area



Both are expressed in terms of force per unit area. Maximum specific impact is a direct indication of spray intensity applied to a surface and can be used to compare spray effectiveness under various conditions.

OPERATING PRESSURE

The values given in the tabulation sections of this catalog indicate the most commonly used pressure ranges for the associated spray nozzle or accessory.

Contact your local steel specialist if your application requires pressure ranges beyond those stated in this catalog.

NOZZLE MATERIALS

For each nozzle there is a selection of "standard" materials that have been determined to meet the usual requirements of the applications most commonly associated with that type of nozzle. Standard materials include brass, steel, various stainless steels, hardened stainless steels, many plastics and various carbides. Spray nozzles can also be supplied in other materials upon special request including:

- AMPCO® 8
- CARPENTER® 20 (Alloy 20)
- Ceramics
- CUPRO® NICKEL
- Graphite
- HASTELLOY®
- INCONEL®
- MONEL®
- Nylon
- Polypropylene, PVC and CPVC
- REFRAX®
- Silicon carbide
- Stellite®
- Titanium
- Zirconium

NOZZLE WEAR

Nozzle wear is typically characterized by an increase in nozzle capacity, followed by a general deterioration of the spray pattern. Flat fan spray nozzles with elliptical orifices experience a narrowing of the spray pattern. In other spray pattern types, the distribution within the spray pattern deteriorates without substantially changing the coverage area. The increase in nozzle capacity can sometimes be recognized by a decrease in system operating pressure, particularly when using positive displacement pumps.

Materials having harder surfaces generally provide longer wear life. The chart below provides standard abrasion resistance ratios for different materials to help you determine if you should consider a different material for your nozzles, orifice inserts and/or spray tips.

Materials that offer better corrosion resistance are also available. However, the rate of chemical corrosion on specific nozzle materials is dependent on the solution being sprayed. The corrosive properties of the liquid being sprayed, its percent concentration and temperature, as well as the corrosion resistance of the nozzle material to the chemical must all be considered.

APPROXIMATE ABRASION RESISTANCE RATIOS

Spray Nozzle Material	Resistance Ratio
Aluminum	1
Brass	1
Polypropylene	1–2
Steel	1.5–2
MONEL	2–3
Stainless Steel	4–6
HASTELLOY	4–6
Hardened Stainless Steel	10–15
Stellite	10–15
Silicon Carbide (Nitride Bonded)	90–130
Ceramics	90–200
Carbides	180–250
Synthetic Ruby or Sapphire	600–2000

See Trademark Registration and Ownership, page i-1.

MAINTAINING SPRAY NOZZLES

Like any precision component, spray nozzles wear over time. Spray nozzle wear can be hard to detect. Small changes in performance can result in quality problems and wasted water, chemicals and electricity. The cost of using worn nozzles can be very significant – tens of thousands of dollars or more per year. Detecting nozzle wear in the early stages can prevent a significant profit drain.

USING NOZZLES THAT ARE SPRAYING JUST 15% OVER THE RATED CAPACITY*

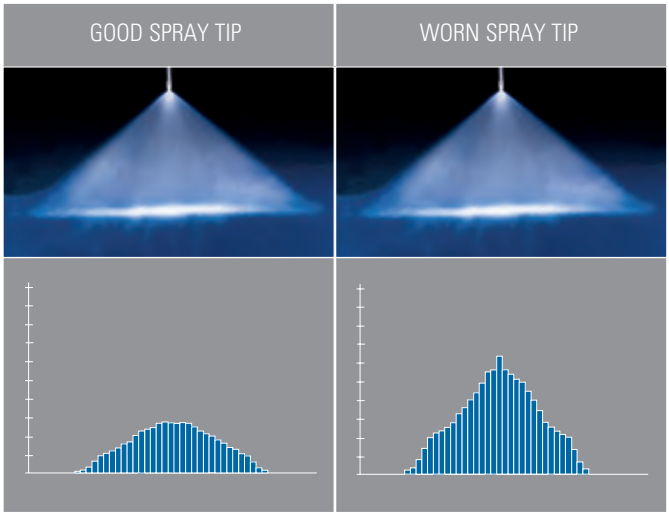
	WASTE	COST OF EXCESS
WATER	1,701,835 gallons (6,442,146 liters)	US $4,680
CHEMICALS	170,165 gallons (644,145 liters)	US $170,164
WASTEWATER DISPOSAL	1,872,000 gallons (7,086,291 liters)	US $7,956
TOTAL COST OF USING WORN NOZZLES:		**US $182,800**

*Based on total system flow of 100 gpm (379 lpm). Water cost of US $2.75/1000 gallons (3,785 liters). Chemical cost of US $1.00 per gallon ($0.264 per liter) and a dilution ratio of 10:1. System operates 2080 hours per year. Increased electricity cost, scrap and downtime due to quality problems are not included.

DETECTING WORN SPRAY NOZZLES

Visually inspecting nozzles is a start but unless wear is significant, it may not be detectable.

The graphic below illustrates this problem. The spray tip on the left is new and sprays properly. The spray tip on the right is worn and sprays 30% over capacity. The difference is undetectable by inspecting the nozzle, but spray collection data reveals the difference between the two tips.



WATCH FOR THESE SIGNS OF NOZZLE WEAR:

- **Quality control issues and increased scrap.** Check for uneven coating, cooling, drying or cleaning and changes in temperature, dust content and humidity
- **Flow rate change:**
  - For centrifugal pumps: monitor flow meter readings to detect increases or collect and measure the flow from the spray nozzle for a given period of time at a specific pressure and compare them to flow rate readings from new, unused spray nozzles
  - For positive displacement pumps: monitor the liquid line pressure for decreases; the flow rate will remain constant
- **Spray pressure in the nozzle manifold:**
  - For centrifugal pumps: monitor for increases in liquid volume sprayed. The spraying pressure is likely to remain the same
  - For positive displacement pumps: monitor pressure gauge for decreases in pressure and reduction in impact on sprayed surfaces. The liquid volume sprayed is likely to remain the same. Also, monitor for increases in pressure due to clogged spray nozzles
- **Deterioration of spray pattern quality.** Visually inspect the spray pattern for changes. Check the spray angle with a protractor. Measure the width of the spray pattern on the sprayed surface

REPLACING WORN NOZZLES

Inspecting and maintaining your nozzles on a regular basis will help identify wear and extend service life. However, wear will occur over time and the only solution is to replace your nozzles.

Here are a few guidelines to help you determine the optimal replacement interval:

- Are worn nozzles affecting product or process quality? If so, replace nozzles as soon as any wear is evident
- Is water conservation a priority? If so, replace nozzles as soon as wear is evident
- How much are you spending by continuing to use worn nozzles? How do the additional costs for water, chemicals, electricity and wastewater disposal compare with the cost of replacement nozzles?
- Is precise spray performance important to your overall process? If so, you may want to set pre-determined dates for nozzle replacement such as annual or semi-annual maintenance shutdowns

For more information on nozzle maintenance and replacement, visit spray.com. Or, contact your local steel specialist for assistance developing a nozzle maintenance program.

PERFORMANCE DATA

PERFORMANCE DATA

INTRODUCTION

PERFORMANCE YOU CAN COUNT ON FOR ALL THE SPRAY APPLICATIONS IN YOUR MILL

The performance data section of *Spray Technology for Steels Mills* is organized by product line, then by spray pattern type. Performance and dimensional data are presented in both English units, beginning on page G4, and metric units, beginning on page G70.

Our experienced steel industry experts are available to help you with product applications and system optimization. To locate your local sales engineer, click here

DIMENSIONS AND WEIGHTS

Nozzle	Nozzle Type	Inlet Conn.	L (in.)
	**DescaleJet® Pro Nozzles**	Available with weld or 1" (M) threaded connection adapters; some styles use a high impact strainer attachment, with or without body adapter for added length. Mini configuration also available. Projection into header varies by connection.	Minimum overall length: 5.59 Maximum length: 7.48 Mini DescaleJet Pro nozzle length: 6.12 Nozzles can be ordered in any length between the minimum and maximum. Longer lengths are available upon request.

Dimensions vary depending on the capacity, configuration and options selected. Contact your local sales engineer to request dimensional data for other descaling nozzle types.

DIMENSIONS AND WEIGHTS

DescaleJet®Pro Tip Body	Assembly No.	L (in.)	Diameter (in.)
	**98016-1-_-SS**	1.87	1.25
	**98016-2-_-SS**	1.87	1.12
	**98016-3-_-SS**	1.87	1.16

DescaleJet Pro Tip Body	Assembly No.	L (in.)	Diameter (in.)
	**98016-4-_-SS**	1.87	1.18
	**98016-5-_-SS**	1.87	.94

For complete information, contact your local sales engineer.

DIMENSIONS AND WEIGHTS

CVCN Check Valves	Nozzle Type	L (in.)
 CVCN check valves in varying lengths to fit existing DescaleJet Pro nozzles.	**DescaleJet Pro with CVCN**	8.1 to 11.2

For complete information, contact your local sales engineer.

Maximum Free Passage Diameter is the maximum diameter as listed of foreign matter that can pass through the nozzle without clogging.
For all 1/4" and 3/8" connections, optimum spray angle is achieved at 40 psi (2.8 bar).
*Maximum operating pressure depends on material, size and application. Contact your local sales engineer for specific recommendations.
Highlighted column shows the rated pressure.

DIMENSIONS AND WEIGHTS

Nozzle	Nozzle Type	Inlet Conn.	L (mm)
	**DescaleJet® Pro Nozzles**	Available with weld or 1" NPT (M) threaded connection adapters; some styles use a high impact strainer attachment, with or without body adapter for added length. Mini configuration also available. Projection into header varies by connection.	Minimum overall length: 142 Maximum length: 190 Mini DescaleJet Pro nozzle length: 155 Nozzles can be ordered in any length between the minimum and maximum. Longer lengths are available upon request.

Dimensions vary depending on the capacity, configuration and options selected. Contact your local sales engineer to request dimensional data for other descaling nozzle types.

DIMENSIONS AND WEIGHTS

DescaleJet® Pro Tip Body	Assembly No.	L (mm)	Diameter (mm)
	**98016-1-_-SS**	47.5	31.75
	**98016-2-_-SS**	47.5	28.6
	**98016-3-_-SS**	47.5	29.5

DescaleJet® Pro Tip Body	Assembly No.	L (mm)	Diameter (mm)
	**98016-4-_-SS**	47.5	30.0
	**98016-5-_-SS**	47.5	24.0

For complete information, contact your local sales engineer.

DIMENSIONS AND WEIGHTS

CVCN Check Valves	Nozzle Type	L (mm)
 CVCN check valves in varying lengths to fit existing DescaleJet Pro nozzles.	**DescaleJet Pro with CVCN**	205 to 285

For complete information, contact your local sales engineer.

Maximum Free Passage Diameter is the maximum diameter as listed of foreign matter that can pass through the nozzle without clogging.
For all 1/4" and 3/8" connections, optimum spray angle is achieved at 40 psi (2.8 bar).
*Maximum operating pressure depends on material, size and application. Contact your local sales engineer for specific recommendations.
Highlighted column shows the rated pressure.

DIMENSIONS AND WEIGHTS

Nozzle	Nozzle Type	Inlet Conn. (in.)	L (mm)	Hex. / flats (in.)	Net Weight (kg)
	BSJ (M)	1/4	49.2	9/16	.03
		3/8	47.6	11/16	.05
		1/2	63.5	7/8	.09
		3/4	69.9	1-1/16	.14
		1	92.1	1-3/8	.31
		1-1/2	111.1	2	.77
		2	174.6	2-1/2	1.36
		3	203.2	3-3/4	3.63
		4	228.6	4-1/2	5.67

Based on the largest/heaviest version of each type.
